Document History

The study documents were developed following the Eastern Washington (EWA) Detailed Study Design Proposal and Quality Assurance Project Plan Template for Operational Best Management Practices (BMPs). A copy of the template is located on the Washington Stormwater Center's website at the following web link: <https://www.wastormwatercenter.org/ew-effectiveness-studies/>

The Detailed Study Design Proposal (Proposal) was submitted to Ecology by Jon Morrow on June 28, 2017. Ecology approved the Proposal via email to Jon Morrow on November 8th, 2017. Appendix A of the Quality Assurance Project Plan (QAPP) contains a copy of the approval letter along with Ecology's comments on the Proposal. Appendix B of the QAPP contains a summary of responses to Ecology's comments including how the comments were incorporated into QAPP.

The draft QAPP was reviewed by members of the Technical Advisory Group (TAG) in January 2018. Appendix C of the QAPP contains a summary of the TAG's comments along with a summary of response to these comments including how the comments were addressed in the QAPP. The final QAPP was submitted to Ecology prior to the May 8, 2018 deadline for their review and comment. Appendix D of the QAPP contains a copy of Ecology's approval letter of the QAPP and a summary of Ecology's comments along with responses to the comments including how the comments were incorporated into the final QAPP document. The revised version of the QAPP was submitted on August 1, 2018.

In June 2020, the QAPP was revised as noted in the Appendix J. Summary of Revisions Table. Generally, the revisions included updating the project schedule and the Technical Advisory Group. The revisions were approved by Ecology in June 2020.

The study started in October 2018 and the last data was collected in April 2020. The draft Technical Evaluation Report (TER) was presented and submitted to the TAG in July 2020 for review and comment. The TAG comments were discussed at an August 2020 TAG meeting. Appendix Q of the TER contains a summary of the TAG's comments along with a summary of response to these comments including how the comments were addressed in this document. The final TER was submitted to Ecology in December 2020.

Distribution List

The distribution list includes each party who will receive a copy of the TER.

2.0 Executive Summary

Street sweeping and catch basin cleaning are operational best management practices (BMPs) that are known to reduce the transport of sediment to receiving water bodies. In the EWA National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System Phase II Permit (MS4 Permit), catch basin cleaning is a required operations and maintenance (O&M) practice. The permit-required frequency of catch basin inspections (and potential cleanings) increased on December 31, 2018. Meeting these requirements creates a logistical and financial challenge for some EWA permittees due primarily to winter climate conditions which can prohibit catch basin cleaning for four months of the year. More frequent street sweeping may provide a solution to meeting the new permit requirements. Specifically, studies have shown that street sweeping can reduce the amount of sediment transported to catch basins during rainfall events. In theory, this could reduce the accumulation rate of sediment in catch basins and subsequently the frequency of which catch basins need to be cleaned.

The goals for this study were to 1) investigate whether the frequency of street sweeping significantly influenced sediment accumulation in catch basins (and transport from catch basins) during the dry season in a semiarid location, 2) recommend a combination of street sweeping and catch basin cleaning procedures for achieving permit requirements for catch basin cleaning, and 3) use the study results to justify a condition in the next permit for O&M procedures that allows street sweeping practices to offset the frequency of catch basin cleanings. These goals were achieved by conducting a two-year study in the City of Ellensburg. The study area is a 1,065-foot long section of SR 97 which includes four catch basins located on each side of the road that each discharge runoff to a swale. During year one (2018), one side of the road (test site) was swept and the catch basins were cleaned every other month starting in April and ending in October. On the other side of the road (control site), the catch basins were cleaned at the same time as the test site however the street was swept in April and October. During year two (2019), the test site and control site switched to the other side of the road and the catch basin cleaning and street sweeping only occurred once in October on the control side. Throughout the study, the City of Ellensburg followed their typical practices for street sweeping and catch basin cleaning and used the same equipment they typically use: a 2016 Elgin Crosswind J Regenerative Air Sweeper and a 2012 VacCon V311/1000 Combination Vactor Truck. Data collected during the study included: precipitation, temperature, and wind speed; street, catch basin, and catch basin washout sediment (wet) weight, moisture content, organic content, and particle size distribution (PSD); and catch basin sediment depth.

The significance of street sweeping frequency compared sediment accumulation in catch basins (and transport from catch basins) was evaluated by comparing the sediment accumulation rates during year one and two. Specifically, sediment accumulation rates from each sample event were calculated at each location (street, catch basins, and catch basin socks) and normalized (days since the last street sweep, basin area, lineal miles swept, etc). A statistical analysis was run to determine if there was a significance difference between data sets at the control site compared to the test site assuming a confidence interval of 95% ($\alpha=0.05$). A two-sample t-test was used for normally distributed data and the Wilcoxon rank sum test was used for non-normally distributed data.

While there was generally a decreasing trend in the sediment accumulation rates in catch basins and catch basin socks (washout) as the frequency of street sweeping increased, the differences between the test side and control side were statistically insignificant ($p=0.95$ and $p=0.96$ respectively). These results suggest that frequency of street sweeping performed within this study does not significantly reduce the rate of sediment accumulation in catch basins (and transported from catch basins). However, that does not mean that more frequent street sweeping does not have a significant effect on catch basin sediment accumulation rates. It just means the results from this study did not prove a significant difference. One reason for these results is extreme variability in site conditions (i.e., wind, sediment loading, rainfall patterns, etc.) can influence the results especially for studies with small sample sizes like this one. For future work, a longer study over multiple years and with considerably more data may mitigate the influence of extreme variability on the results and increase the likelihood of demonstrating a significant difference.

In semi-arid regions that have distinct wet and dry seasons, more frequent street sweeping during the dry season should reduce sediment transport to catch basins during the wet season. This is because rainfall events are less frequent and may not produce enough runoff energy to transfer a significant amount of sediment to catch basins. As such more frequent sweeping throughout the drier season can reduce the sediment accumulation on roads, which should reduce the sediment that could be transferred catch basins during the wet season.

A recommended schedule for catch basin cleaning based on the frequency of street sweeping was developed using the data collected from this study. A linear least squares regression analysis indicated a strong linear correlation ($R^2=0.9354$) between street sweeping frequency and the time it would take for the catch basin sump to fill (60% full). These recommendations are specific to the site where the study was conducted. A literature review was conducted to identify site specific conditions that may influence the transferability of recommendations from this study to a different site. A synthesis of the literature is provided along with considerations for applying the results to other sites.

3.0 Introduction

3.1 Introduction to the Operational BMP

This study focused on evaluating the effectiveness of street sweeping and catch basin cleaning practices. These operational best management practices (BMPs) are generally described as preventative actions that prevent or reduce pollutant runoff (EPA & ASCE, 2002). Catch basins are located adjacent and flush with the curb line. Catch basins are configured with a grate inlet, which allows runoff from the roadway to enter the catch basin. Pipes (storm drains) connected to the catch basin(s) convey runoff to downstream BMPs such as swales or receiving water bodies. Catch basins typically have a low area (sump) below the invert of the pipes that can retain sediment (conveyed with roadway runoff to the catch basin), reducing the quantity of solids that are conveyed through the storm drain network into receiving waters (EPA, 1999). A vactor truck is periodically used to remove sediment from catch basins by vacuuming the solids out of the catch basin for disposal. In comparison, street sweeping removes sediment accumulation on roads, using a vacuum assisted sweeper truck. Street sweeping is known to reduce the quantity of sediments conveyed to catch basins during rainfall events (Caraco, 2000).

The Eastern Washington Phase II NPDES MS4 Permit (2014-2019) minimum control measure for Municipal Operations and Maintenance (O&M) specifies that permittees “...implement an operation and maintenance program with the goal of preventing or reducing pollutant runoff from municipal operations.” In response to this requirement, the City of Ellensburg Stormwater Department developed an O&M Plan which includes street sweeping 100 miles of road and cleaning approximately 2,500 catch basins (City of Ellensburg, 2017). This typically includes sweeping the streets twice a year, once in the spring and again in the late summer, using a 2016 Elgin Crosswind J Regenerative Air Sweeper. On the other hand, approximately 600 catch basins are cleaned every year using a 2012 VacCon V311/1000 Combination Vactor Truck. In 2016, the combination of these practices collected an estimated 760 tons of solids which were disposed of at the city’s decant facility and then transferred to the Wenatchee Waste Management (WM) Landfill (City of Ellensburg, 2017). *Section 4.0 provides more details about the City of Ellensburg’s street sweeping and catch basins cleaning practices.*

3.2 Problem Description

The required frequency of catch basin cleaning and inspection is explicitly defined in the O&M section of the NPDES Municipal permit. Street sweeping was not required in the 2014-2019 permit however it was added to the 2019-2024 permit. With respect to catch basins, permittees are required to develop and implement an O&M plan that includes cleaning, regular inspection, and record keeping of the jurisdictions catch basins. In addition, all catch basins and inlets must be inspected once before December 31, 2018 and then every two years thereafter (Ecology, 2014). If the inspection shows it is necessary to clean the catch basin, typically when sediment exceeds 60% of the catch basin depth (Tetra Tech, 2001), the permittee must clean the catch basin. Alternatively, permittees may select other options for meeting this requirement which include (Ecology, 2013):

1. Establishing a specific, less frequent schedule based on documented evidence.
2. Identifying circuits and inspecting 25 percent of the catch basins within each circuit (frequency set by permit either annually or every two years).

3. Cleaning the whole system, including all pipes, ditches, catch basins, and inlets within a circuit once during the five-year permit term, where the circuit drains to a single discharge point.

Note: An outcome of this study is to address item 1, provide documented evidence that will support a less frequent schedule for catch basin cleaning based on the frequency of street sweeping.

Increasing the frequency of catch basin inspections (and potential cleanings), creates a logistical and financial challenge for some eastern Washington (EWA) jurisdictions. Specifically, in locations like the City of Ellensburg that typically experience prolonged durations of snow cover and ice on the roads during the winter months these climate conditions can prohibit catch basin cleaning for 4 months out of the year. Western Washington (WWA) Phase II permittees have the similar catch basin cleaning requirements (see Table 3.1), however, since most WWA jurisdictions experience significantly less snow and ice build-up (if any) on their roads, their catch basin cleaning activities are not impacted to the same degree by climate conditions. For comparison, Figures 3.1 and 3.2 are included to illustrate some of the differences in climate conditions between Ellensburg and Olympia. The subsequent paragraphs in this section provide more details about Ellensburg's climate conditions and explain why these conditions are important to this study.

Note: An outcome of this study is to demonstrate the need for O&M permit requirements that reflect EWA climate conditions.

Ellensburg is located in Central Washington, a semi-arid region with climate conditions that are characterized by cold winters with snowfall, hot dry summers with high winds (WRCC, no date), and short-duration high intensity rainfall events from late spring through early fall (WSDOT, 2016). During the dry season (April to September) the average monthly precipitation ranges from 0.24-inches (August) to 0.67 inches (May) with maximum daily wind speeds ranging from 20 mph to 25 mph. The average maximum daily temperature ranges from 61 degrees (April) to 86 degrees (August). Rainfall events during the dry season provide on average 3-inches of the 9 mean annual precipitation (MAP) and these short duration, high intensity events are known to deposit 1-inch of rain in less than 30 minutes (based on NOAA historical rainfall records). Conversely, the wet season (October to March), provides the remaining 6-inches of MAP of which an average of 22-inches occurs as snow fall.

Variables such as climatic conditions are known to influence the effectiveness of stormwater management BMPs (Caraco, 2000; Sayre, 2006; Gautam, Acharya, Stone, 2010; Tyagi, Chongtoua, Medina, 2008). For example, in semi-arid areas like Ellensburg, roadway sediment accumulation and stormwater runoff pollutant concentrations from roads tend to be higher than marine areas like Olympia. The reason for this is pollutants and sediments have more time to build up on impervious surfaces due to the longer duration of dry periods between rain events. Recommended strategies for semi-arid areas include more frequent street sweeping during the dry period to reduce the quantity of pollutants and sediments on impervious surfaces thereby reducing the quantity available for transport to catch basins and downstream water bodies (Caraco, 2000). Figure 3.3 shows an example of sediment accumulation on roads and in a catch basin in Ellensburg during the dry season.

Table 3.1 Comparison of WWA and EWA Catch Basin Cleaning 2019 Permit Requirements, Permits Effective August 1, 2019

	WW Phase I Permit	WW Phase II Permit	EWA Phase II Permit
Catch Basin Cleaning Requirements			
Permit Section	S5.C.10.d.i	S5.C.7.c.iii.	S5.B.6.a.ii.b
Inspection Frequency	Annually, or alternative inspection schedule	Every 2 years, or alternative inspection schedule	Every 2 years, or alternative inspection schedule
Permit Section	S5.C.10.d.i	S5.C.7.c.iii.	
Alternative Inspection & Cleaning Schedules	(a) Inspection schedule may be changed to meet the maintenance standards based on maintenance records of double the length of time of the proposed inspection frequency or written statements to document a specific, less frequent inspection schedule.		(1) Catch basin inspection schedule may be changed to meet the maintenance standard based on maintenance records of double the length of time of the proposed inspection frequency or written statements to document a specific, less frequent inspection schedule.
	(b) Annual inspections may be conducted on a "circuit basis" whereby 25% of catch basins and inlets within each circuit are inspected to identify maintenance needs.	(b) Inspections every two years may be conducted on a "circuit basis" whereby 25% of catch basins and inlets within each circuit are inspected to identify maintenance needs.	(2) Inspections every two years may be conducted on a "circuit basis", whereby 25% of catch basins and inlets within each circuit are inspected to identify maintenance needs.
	(c) The Permittee may clean all pipes, ditches, catch basins, inlets within a circuit (draining to a single point) once during the permit term.		(3) The Permittee may clean all pipes, ditches, catch basins, inlets within a circuit (draining to a single point) once during the permit term.
Permit Section	S5.C.10.a.ii	S5.C.7.a.ii	NA
Timeline for Cleaning Following Inspection	Within 6 months for catch basins, unless encounter denial or delay of access by property owners, denial or delay of necessary permit approvals, unexpected reallocations of maintenance staff to perform emergency work. For each exceedance of the required timeframe, and the Permittee shall document the circumstances and how they were beyond the Permittee's control.		NA
Street Sweeping Requirements			
Permit Section	S5.C.10.e	S5.C.7.d	S5.B.6.a.i.b
Requirements Involving Street Sweeping	Each Permittee shall implement practices, policies, procedures to reduce stormwater impacts associated with runoff from all lands owned/maintained by Permittee, and road maintenance activities under the functional control of the Permittee. No later than 12/31/22 document the practices, policies, procedures. Street cleaning activities must be addressed.	Implement practices, policies, and procedures to reduce stormwater impacts associated with runoff from all lands owned or maintained by the Permittee, and road maintenance activities under the functional control of the Permittee. No later than 12/31/22, document the practices, policies, and procedures. Street cleaning activities must be addressed.	Permittees shall implement a schedule of municipal O&M activities (Plan). Permittees shall review and, if needed, update the Plan no later than 12/31/22. The Plan shall include appropriate pollution prevention and good housekeeping procedures for roads, highways, parking lots including street cleaning.

3.3 Study Goals

The goal of this study was to determine whether the frequency of street sweeping significantly reduces the rate of sediment accumulation in catch basins (and transported from catch basins) during the dry season in a semi-arid location. The intent was to use results from this study to recommend a combination of street sweeping and catch basin cleaning procedures for achieving permit requirements for catch basin cleaning. If the study results indicate that the frequency of street sweeping significantly reduces sediment accumulation in catch basins, the results will be used to justify a condition in the next permit for O&M procedures that allows street sweeping practices to offset the frequency of catch basin cleanings.

3.4 Study Description and Objectives

A paired study was conducted on a 1065-foot section of State Route (SR) 97 with the test site located on one side of the road and the control site located on the other side (Figure 3.4). Each site has four catch basins located on the side of the road (eight catch basins total). Runoff from the road enters the catch basins through a herringbone grate inlet and then discharges from the catch basin through a storm drainpipe that outfalls into biofiltration swales (swale) (Figure 3.5). This study occurred over 2 years and data collection primarily occurred over 6 months (April to October) each year. The first year (2018), the test site was swept every other month starting in April while the control site was only swept once in April and October. The following year (2019) the control site and test site were switched to the other side of the road same street sweeping occurred every other month at the test site from April to October and only in October at the control site. All catch basins were cleaned, using a vactor truck, every other month starting in April in 2018 and 2019. Both street sweeping and catch basin cleaning followed the City's typical practices.

Sediment accumulated on the road, in the catch basins, and transferred from the catch basins was collected and measured. The sediment collected in the vactor truck and street sweeper was transported to the City's decant facility where it was dewatered and then weighed. Samples of the sediment were collected to determine the moisture content which was used to calculate the dry weight of the sediment collected. Before the catch basins were cleaned the average depth of

sediment accumulated in the catch basins was measured at five different locations in each catch basin. Then sediment was collected from each catch basin using the City's vactor truck. The storm drainpipe outfalls were fitted with a catch basin sock which captured sediment that was transported from the catch basins before discharging to the swales (Figure 3.5). Every other month, the catch basin sock was collected (replaced) and the dry weight of sediment collected in each sock was determined. The particle size distribution (PSD) of sediments collected from each location (roadway, catch basins, and catch basin socks) was determined. Organic content was also determined only for the catch basin sediment. Climate data (precipitation and wind speed) were collected over the duration of the study period. Section 5.0 contains more details regarding data collection.

The study goals were achieved by meeting the following objectives:

1. Characterize the sediment collected (particle size distribution and organic content) of from each sample location (roadway, catch basins, and catch basin socks) at both the test site and control site.
2. Quantify the accumulation rate of sediment on the street, in catch basins, and in catch basin socks, without employing (control site) and while employing (test site) street sweeping.
3. Identify potential weather-related methods of sediment transport to the road, catch basin, and catch basin socks and assess representativeness of the climate conditions during the study (compared to historical records)
4. Determine whether there is a statistically significant difference between the sediment accumulation rate in the catch basins and in the catch basin socks (washout from the catch basin) at the test site compared to the control site.
5. Evaluate whether there is a correlation (using a regression analysis) between catch basin sediment accumulation rates and street sweeping frequency that could be used to develop a schedule for catch basin cleaning and provide recommendations for applying the results.
6. Summarize the study results.

Figure 3.4 Aerial view of the propose study area in the City of Ellensburg

Figure 3.5 Typical Cross Section of Stormwater System in the Study Area

¹ The test-site and control-site will switch to the other sides of the road for year two.

Figure 3.6 Aerial view of the proposed study area showing the locations of the test site and control site

Note: For year one, the test site was the north side of the road, and the control site was the south side of the road. During year two, the south side was the test site and the north side was the control site.

3.5 Study Location

The proposed study area was a 1065-foot section of road on State Route 97 located in Ellensburg, Washington between Desmond Road and West University Way (Figure 3.6). This principal arterial is a major hay hauling route and the land use in the study area is primarily commercial and light industrial. The road has four 12-foot lanes, a 12-foot turning lane, and two 4-foot shoulders (Figure 3.7). The speed limit on the road is 40 mph with an approximate average daily traffic (ADT) of 4000. The study location was selected because the proposed test site and control site provide equivalent areas for comparison including:

- The areas have the same average daily traffic (ADT), roadway topography, land use, and the same number of catch basins which are configured to discharge to swales.
- Typical variables that affect the results are not present at the study location such as leaf litter from tree canopies and parking is not permitted on the road so parked cars will not interfere with street sweeping and catch basin cleaning practices.

The study area was surveyed in July 2017 (Appendix A) and the results of the survey were used to delineate the basin areas summarized in Table 3.2, Figure 3.8, and described herein. The study area starts at station 0+00 and ends at station 10+65 and the longitudinal roadway slopes is 0.33% from the North West to the South East. The roadway crown is in the center of the highway which directs half of the runoff to each side of the road. The area contributing runoff to each catch basin is from PGIS which includes the road and approaches (Figure 3.9) to local. The area adjacent to the approaches (away from the road) is not included in the basin delineation because these areas slope away from the road. The contributing basin areas to the catch basins range from 0.17 to 0.30 acres. Area differences are due to the locations of the inlets and the size of the approaches.

4.0 Operational BMP Description

The city's typical street sweeping and catch basin cleaning practices were documented from interviews with the equipment operators and the city's stormwater manager. A copy of the interview notes is located in Appendix E of the QAPP. This section provides a summary of the typical operating procedures for street sweeping and catch basin cleaning.

4.1 Street Sweeping

Street Sweeping occurs twice per month for principal arterials, once per month for secondary arterials, and once per year for collectors. The streets are swept using a 2016 Elgin Crosswind J Regenerative Air Sweeper. Regenerative air sweepers use rotating brooms and pressurized air on the street side of the pickup head under the vehicle to dislodge material from the street surface. Brooms rotate in opposite directions toward the center of the vehicle to direct material to the pickup head instead of to the outside of the vehicle (i.e. curb and gutter). A vacuum is applied on the opposite side of the pickup head from the pressurized air to pull material into the hopper. The frequencies and practices were modified during the study to sweep the test and control site once every other month and immediately following catch basin cleaning. The detailed modifications to procedures for this study are described in more detail in Section 8.1.3 of the QAPP. Typical street sweeping procedures in Ellensburg are as follows:

- Step 1: At the start of the route to be swept, the sweeper pulls alongside the curb as closely as possible while still allowing the rotating brushes to reach the gutter.
- Step 2: Once the sweeper is aligned with the curb, the manifold at the front of the sweeper releases water to wet the pavement. The water is used to provide dust control, particularly later in the day, when transport of fines by wind is expected to be higher. Once the manifold is started, the brooms begin to rotate and are lowered, and the blower and vacuum near the rear of the sweeper is started.
- Step 3: The sweeper drives along the curb and gutter until the route is completed. Because higher amounts of material are expected to collect in and adjacent to the gutter, a single pass on each side of the street is typical. Once a year and following the winter season, an additional pass along the center median of arterials is performed to capture material in or next to the center median.
- Step 4: After sweeping is complete, the sweeper drives to the City's decant facility for disposal of material collected on the route.

4.2 Catch Basin Cleaning

To date, each catch basin is cleaned approximately once every four years using a 2012 VacCon V311/1000 Combination Vector Truck. This frequency was modified during the study to clean catch basins at the test and control site every other month. During the months when both street sweeping and catch basin cleaning occur the catch basins were cleaned prior to street sweeping. The modifications to procedures for this study are described in more detail in Section 8.1.2 of the QAPP. Typical catch basin cleaning procedures in Ellensburg are as follows:

- Step 1: The vector truck drives to the catch basin to be cleaned, and parks alongside the curb so the front of the truck and vector arm are in line with the inlet.

- Step 2: The catch basin grate is removed, and the arm is lowered to the bottom of the catch basin by use of remote control.
- Step 3: The vacuum is started and a high-pressure water hose attached to the truck is used to wash any material adhered to the walls of the catch basin towards the bottom of the catch basin.
- Step 4: Once the accumulated material and water is removed from the catch basin, the vactor is removed and the grate is replaced on the catch basin.
- Step 5: Material collected during the catch basin cleaning is transported to the City's decant facility for disposal.

4.3 Equipment

The City of Ellensburg Stormwater O&M Plan includes street sweeping 100 lineal miles of road and cleaning approximately 2500 catch basins (City of Ellensburg, 2017). The city owns one street sweeper, an Elgin Crosswind J street sweeper, and two vactor trucks, VacCon Combination Truck. A summary of the equipment specifications is summarized in Table 4.1 with detailed equipment information located in Appendix E of the QAPP.

Table 4.1 Street Sweeper and Vactor Truck Equipment Specifications

2016 Elgin Crosswind J Street Sweeper (2016 Freightliner Chassis)	
Material Storage Capacity	8 CY
Broom Type	Dual Gutter Brooms
Total Sweeping Path	120 in.
Vacuum Pickup Head	2700 sq. in.
Blower Rating	20,000 cfm
Water Storage Capacity	240 gal
Number of Spray Nozzles	16
Pick-Up Efficiency	96.4%
2012 VacCon V311/1000 Combination Truck (2012 International Chassis)	
Material Storage Capacity	11 CY
Diameter of Vacuum Hose	8 in.
Vacuum Pickup Head	200 in. H ₂ O
Blower Rating	8000 cfm
Water Storage Capacity	1000 gal

5.0 Sampling Procedures

5.1 Types of Data Collected

This section provides an overview of the types of data that was collected. Table 5.1 summarizes the various types of data collected, the location where data was collected, equipment used to collect data, the frequency of data collection, and the total number of samples collected. Table 5.2 provides a timeline for when this data was collected. An overview of the sampling procedures is in the subsequent sections and the detailed sampling procedures are in Section 8.0 of the project QAPP. Appendix B-E contains the raw data measurements for each sample event.

Table 5.1 Summary of Data Collected

Data Type	Data Collection Location	Equipment Used to Collect Data	Frequency	Total Number of Samples
Precipitation, Temperature, and Wind Speed	Weather Station	Weather Station	Daily throughout the study	Continuously
Catch Basin Sediment Depth	All <i>Test Site</i> Catch Basins	Survey Rod	Every other month before the catch basins were cleaned	32
	All <i>Control Site</i> Catch Basins			32
Catch Basin Sediment Wet Weight and Moisture Content	All <i>Test Site</i> Catch Basins	Vactor Truck	Every other month for two 6-month periods; starting on April and ending in October	8 & 21
	All <i>Control Site</i> Catch Basins			8 & 21
Roadway Sediment Wet Weight and Moisture Content	Roadway Length at <i>Test Site</i>	Street Sweeper	Every other month for two 6-month periods; starting on April and ending in October	8 & 21
	Roadway Length at <i>Control Site</i>			3 & 7
Catch Basin Sock Sediment Dry Weight	All <i>Test Site</i> Catch Basin Socks	Manual	Every other month for two 6-month periods; starting on April and ending in October	24
	All <i>Control Site</i> Catch Basin Socks			25
Roadway, Catch Basin, and Sock Sediment PSD	Each <i>Test Site</i> & <i>Control Site</i> sample location (roadway, catch basin, socks)	Manual	Two times per year from April through October (Roadway and Sock), 4 times per year from April through October (Catch Basin)	4, 16, & 6
Roadway, Catch Basin, and Sock Sediment Organic Content	All <i>Test Site</i> & <i>Control Site</i> (roadway, catch basin, socks)	Manual	2-3 times per year	9, 22, & 2
Catch Basin Bulk Density	All <i>Test Site</i> & <i>Control Site</i>	Manual	1 time	3 & 3

- Street Sediment Weight** - Collected roadway sediment and measured the wet weight from the control site twice (2018) and once (2019) and from the test site four times per year (8 total) for a combined total of 11 wet weights over the duration of the study. After weighing the sediment, triplicate samples of sediment were collected and submitted to the lab to measure the moisture content. The analytical laboratory used at the beginning of the study made an error and created a composite of the first set of samples (one sample from each location instead of triplicates from each location). Following this incident, the samples were sent to a different lab for the duration of the study. As such, a total of 28 samples were collected and analyzed over the duration of study.
- Catch Basin Sediment Weight** - Collect sediment from all the catch basins at the control site and then all the catch basins at the test site. The sediment wet weight was measured four times per year for a total of 8 wet weights per year (16 wet weights total over the duration of the study). After weighing, triplicate samples of sediment were collected and submitted to the lab to measure the moisture content. The analytical laboratory used at the beginning of the study created a composite of the first set of samples. Following this incident, the samples were sent to a different lab for the duration of the study. As such, a total of 42 samples were collected and analyzed over the duration of study.
- Catch Basin Sediment Depth** - Measured the depth of sediment in each catch basin every other month at the test site (16 catch basins per year for a total of 32 measurements over the duration of the study) and at the control site (16 catch basins per year for a total of 32 measurements over the duration of the study).
- Particle Size Distribution (PSD)** - Sediment samples were collected and submitted to the lab to determine the PSD. The samples were collected from the roadway sediment (3 from the test site and 1 from the control site for a total of 4 over the duration of the study), the catch basin sediment (8 from the test site and 8 from the control site for a total of 16 over the duration of the study), and catch basin sock sediment (3 from the test site and 3 from the control site for a total of 6 over the duration of the study).
- Catch Basins Sock Sediment Weight** - Collected sediment that washed out from the catch basins (into the socks located in the catch basins) and submitted the socks to the lab to determine the sediment dry weight. This included collecting the socks every other month that are located in the catch basins at the test site (12 socks for year one and 12 socks for year two for a total of 24 socks over the duration of the study) and at the control site (9 socks for year one and 16 socks for year two for a total of 25 socks over the duration of the study). It is important to note that due to the site configuration, there are 4 catch basins on the north side of the road and only 3 catch basins on the south side of the road.
- Organic Content** - Samples of sediment from the street sediment and catch basins were submitted to lab to determine the organic content measured as total volatile solids (TVS). Triplicate samples were collected during each sample event except for two events when the lab erroneously combined the triplicate sample into a composite sample before testing the organic content. Samples were collected from the street sediment once per year at the test site (for a total of six samples over the duration of the study) and once from the control site during year two (for a total of three samples over the duration of the study). Samples were collected from the catch basins at the test and control site twice during year one (for a total of four samples from the test site and four from the control site) and three times at the test and control site twice during year two (for a total of seven samples from the test site and seven from the control site). Samples were collected from the catch basin socks once from the test and control site in April 2020 for a total of 2 samples.
- Lab Fire** - Catch basin socks that were collected during the April 2019 data collection event were destroyed in a fire. The fire occurred at the analytical lab during the drying process used to obtain the dry weight of the catch basin socks. Following the fire, the lab adjusted their procedures to minimize the possibility of another fire. Because the data was lost, a catch basin sock was installed in October 2019 and collected in April 2020 to approximate how much sediment would have been collected in the catch basin sock in April 2019. *The April 2020 catch basin sock results are substituted for the April 2019 catch basin sock results throughout this report.*
- Catch Basin Sediment Bulk Density** - The bulk density of sediment collected in the catch basins from the test site (n=3) and the control site (n=3) was measured at 80% compaction. This information was collected to estimate the weight of sediment when the catch basins are full (~60% depth) as part of the analysis to determine the relationship between catch basin accumulation and street sweeping frequency (Section 7.5).

5.2 Sample Collection Process and Design(s)

This section provides an overview of the process for collecting the various types of data including the equipment that was used to collect samples and where applicable the design of the sample collection system is described. Reference Section 8.0 of the QAPP for the detailed standard operating procedures (SOPs) for collecting samples and measuring field data.

5.2.1 Weather Data

A weather station recorded precipitation, temperature, and wind speed data continuously at 15-minute intervals throughout the duration of the study. The weather station is located at 1306 W. Dolarway Road, which is approximately 1.5 miles from the study area as shown in Figure 5.1. The parcel where the weather station is located is owned by DirectTV, Inc. Personnel at that property operated and maintained the weather station. This weather station stopped operating November 25, 2018 through March 6, 2019 and June 16, 2019 through the end of the study, potentially due to equipment malfunction. An equivalent weather station was located at Central Washington University (CWU) and data from this station was used to replace missing data from November 25, 2018 to March 6, 2019 and from June 17, 2019 to the end of the study. The CWU station is located on the roof of the Hogue Technology Building on campus, approximately 2.5 miles from the study area as shown in Figure 5.1. CWU staff operated and maintained the weather station.

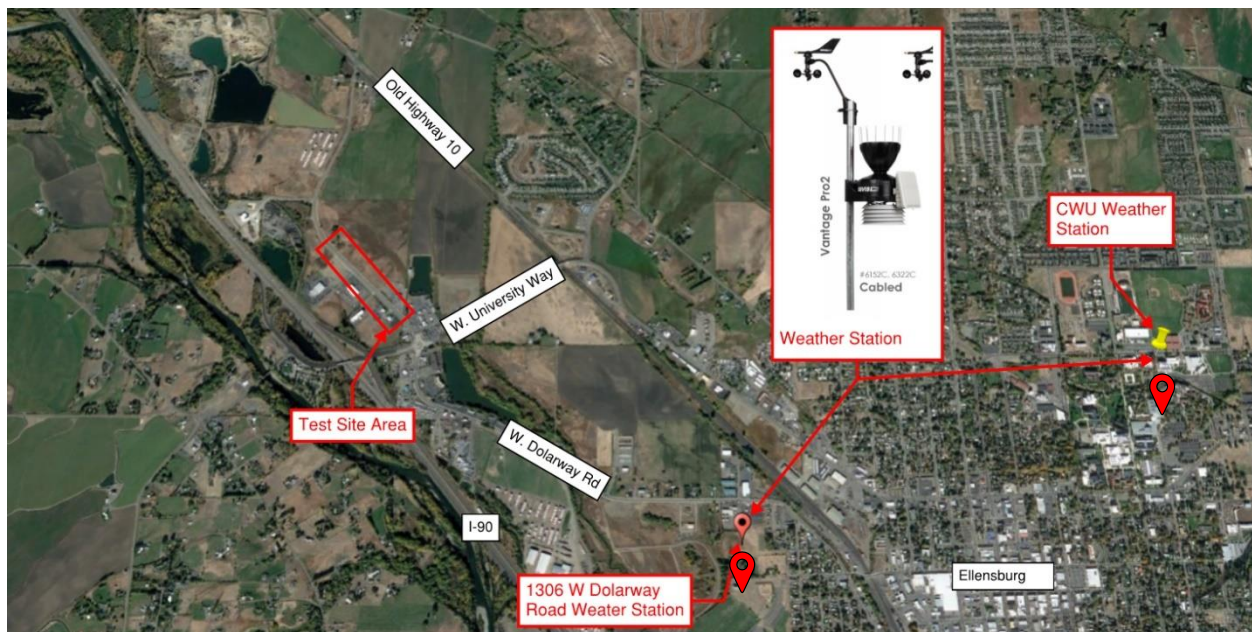

Figure 5.1 Location of Weather Station in Relation to the Study Area

The 1306 W Dolarway Rd and CWU weather stations are Davis Instruments Vantage Pro2 stations, which measure rainfall, wind speed and direction, temperature, and humidity. Precipitation depth is recorded using a tipping bucket. The bucket has a level of accuracy of $\pm 4\%$ or ± 0.01 -inches, whichever is greater, for rain rates up to 4-inches per hour. Rainfall data is recorded every 20-24 seconds. A storm event is recorded once 0.02-inches has accumulated within the bucket, and the storm event is ended after 24 hours without further accumulation.

Wind speed is measured using a cup anemometer in 1 mile per hour (mph) increments and recorded every 2.5 to 3 seconds. The data is compiled into 10 to 15-minute intervals. The meter has a range of 1 to 200 mph and an accuracy of ± 2 mph or $\pm 5\%$, whichever is greater.

Temperature is measured using a PN junction silicone diode (thermal diode), located beneath a solar radiation shield on the station. The temperature sensor measures temperature between -40°F and 150°F . The temperature sensor is accurate to within $\pm 0.5^{\circ}\text{F}$. Temperature is updated every 10 seconds and is compiled into 10- to 15-minute intervals.

Data recorded by the weather stations is uploaded to Weather Underground (wunderground.com), a website which presents forecast and historical weather data. Data for the weather station at 1306 W Dolarway Road can be accessed and downloaded by the public at the webpage for the station (<https://www.wunderground.com/personal-weather-station/dashboard?ID=KWAELLEN22>).

Data for the weather station at CWU can be accessed and downloaded by the public at the webpage for the station (<https://www.wunderground.com/dashboard/pws/KWAELLEN13>).

5.2.2 Catch Basin Sediment Depth

The depth of sediment in each catch was measured using a fiberglass, telescoping survey rod with hundredths of a foot gradations. This included measuring from the rim of the catch basin to the top of the sediment in five different locations (Figure 5.2) before cleaning catch basins and subtracting these measurements from the depth of the catch basin empty. The average sediment depth in each catch basin was determined by averaging the five measurements. The SOP for measuring the sediment depth is located in Section 8.1.1 of the QAPP.

Figure 5.2 Catch basin sediment depth: measure in five locations full (left) and empty (right)

5.2.3 Catch Basin Sediment Wet Weight and Moisture Content

The catch basin sediment was collected from the test site and control site separately in the city's vector truck (Figure 5.3) following the procedures defined in Section 8.1.2 of the QAPP. The sediment was transported to the city's decant facility. Once the truck arrived at the decant facility, the sediment was transferred to a basin for dewatering (Figure 5.4). The transfer of sediment to the basin took approximately 5-10 minutes to prevent water and sediment from spattering outside of

the basin. Any excess which fell outside the basin was shoveled into the basin. The dewatering basin was retrofitted with drains covered with a 1 micron felt filter fabric and attached to ball valves. However, the filter fabric immediately clogged during the first sampling event, inhibiting drainage. The filter fabric was removed, and the dewatering basin and sediment were allowed to sit for 5-7 days to allow small particles to settle to the bottom of the basin. The sediment was dewatered by opening the valves according to the SOPs in Section 8.1.5 of the QAPP.

After excess water was drained, the basin was transported to a scale using a forklift and pallet located under the basin to measure the wet weight. A Coti Global floor scale and Transcell TI-500E SS digital indicator were used to measure the weight. The scale is 4-feet by 4-feet, with a 10,000-pound capacity. The digital indicator is set to display load from the floor scale in 0.1-pound increments. The sensitivity of the scale and digital indicator is 3 millivolts per volt (mV/V). The accuracy of the scale is $\pm 1.06\%$. Additional information about the scale and digital indicator is in Appendix M of the QAPP and the scale calibration is described in Section 8.1.3 of the QAPP. After the sediment was weighted, three samples were collected and submitted to the lab to determine the moisture content of the sediment collected.

Figure 5.3 Catch Basin Sediment Accumulation Data Collection

Figure 5.4 Dewatering Basin Prior to Settling (Left) and Following Dewatering (Right)

5.5.4 Roadway Sediment Wet Weight and Moisture Content

The roadway sediment was collected from the test site and control site separately in the city’s street sweeper following the procedures defined in Section 8.1.3. Sediment from the test site and control site was collected and weighted separately. The sediment was transported to the city’s decant facility and transferred to a basin for dewatering (Figure 5.5). Transfer of the sediment to the basin took approximately 5-10 minutes to prevent water and sediment from spattering outside of the basin. Any excess which fell outside the basin was shoveled into the basin. The process for dewatering, weighting the sediment, and collecting moisture content samples is the same as described in Section 5.2.3 of the QAPP.

Figure 5.5 Roadway Sediment Accumulation Data Collection

5.5.5 Catch Basin Sock Sediment Dry Weight

Sediment washed out of the catch basins through the storm drainpipe was collected in a sock (a 1-micron filter bag) that was installed in a catch basin on the discharge end of the pipe in the swale. An example of the typical setup is illustrated in Figure 5.6. The QAPP contains detailed installation in Figure 7.8b and a copy of the sock cut-sheet is in Appendix G. The catch basin was retrofitted with 1-inch drain holes on the bottom of the catch basin to allow excess water to drain from the catch basin. Underneath the catch basin, existing soils were replaced with a 2-foot by 2-foot by 2-foot section of 3-inch to 1½-inch gravel infiltration trench. The trench provided additional storage for runoff discharging from the catch basin to reduce the amount of water in the catch basin, subsequently reducing the period that the sock is saturated. Sediment captured in the sock was collected every other month after the respective catch basin is cleaned (Figure 5.7). This included flushing the drainpipe of any residual sediment using the hose on the vector truck. After excess water drained from the sock, the sock was collected and replaced with a new sock. The old sock was transferred to a sealable plastic container and submitted the lab to determine the sediment dry weight collected in each sock. The standard operating procedures for collecting sediment washout from catch basins is in Section 8.1.4 of the QAPP.

Figure 5.6 Typical Detail for Catch Basin Sock Installation

Figure 5.7 Catch Basin Socks: after 2 months use (left), uninstalled (middle), installed and new (right)

5.5.6 Street, Catch Basin, and Catch Basin Sock Sediment Particle Size Distribution

One to four times each year (see Table 5.2), samples of sediment collected from the roadway, catch basins, and catch basin socks were analyzed for organic content and particle size distribution. After the sediment was weighed, samples were collected and submitted to the lab for analysis. The QAPP includes standard operating procedures for collecting samples in Section 8.1.6 and laboratory testing methods and procedures in Section 9.0.

6.0 Data Quality Assessment

This section describes the assessment performed to review the quality of the data collected during the study. The purpose of the assessment was to determine whether measurement performance criteria (MPC) identified in the project QAPP were met for each of the six data quality indicators (DQIs). DQIs are qualitative and quantitative measures that characterize the aspects of quality data, and the DQIs for the project include bias, precision, representativeness, completeness, comparability, and sensitivity. MPCs are the acceptance criteria for the DQIs which specifies how good the data must be to meet the project objectives. Detailed definitions of each DQI and descriptions for each MPC are included in Section 6.0 of the project QAPP. This section describes the evaluation of each DQI with respect to the MPCs for the data collected during the study. An audit was conducted each year (Appendix M) to verify the study was conducted in conformance with the QAPP.

6.1 Bias

Bias is a systematic error that results in sample values that are consistently distorted in a particular direction from the “true” or known value (EPA, 2006; Erickson, 2013). Bias can result from improper data collection, poorly calibrated analytical or sampling equipment, or limitations and errors in analytical methods and techniques (Ecology, 2011).

DQI #1: Following the manufacturer’s recommendations for equipment maintenance can reduce the potential of bias in the quantity of sediment collected.

MPC #1: All equipment maintenance will be performed per the manufacturer recommendations and at the frequency recommended by the manufacturer.

Assessment: Routine maintenance and minor repairs were conducted on the vector truck and sweeper during the study duration. Maintenance was conducted in accordance with manufacturer recommendations as verified from audits (Appendix M) of the maintenance records (Appendix N).

DQI #2: Consistently following the SOPs for collecting samples and measuring data will minimize errors and reduce the potential of collecting biased data.

MPC #2: The field crew will follow the SOPs defined in the project QAPP.

Assessment: Field audits were performed in June 2018 and August 2019 (Appendix M) to assess whether the field crew was following the SOPs. Results from the audits indicate that the field crew followed the SOPs (QAPP Section 5.2).

DQI #3: The scale used to weigh sediment during the study will be calibrated per manufacturer’s recommendations to reduce the potential for bias in the sediment weight data.

MPC #3: The scale calibration will occur prior to the start of data collection for each year.

Assessment: The City rented the scale from the vendor during the study. The vendor would deliver in the scale in April to the decant facility and pick the scale up in October. Once

the scale was delivered, the vendor would calibrate the scale as part of the contract with the City.

6.2 Precision

Precision is a measure of agreement among repeated measurements of the same property taken under identical or substantially similar conditions (EPA, 2006; Erickson, 2013; EPA, 2002). Data is considered precise when the measured values are consistently the same and imprecise when the measured values are consistently different (Erickson, 2013). Random error is a common cause of imprecise data and is always present because of normal variability in the many factors that affect measurement results. For example, variability in sampling or data collection procedures and/or variations of the actual concentrations in the media being sampled (Ecology, 2011).

DQI #1: Developing and consistently following the SOPs for collecting samples and measuring data will reduce the potential of collecting imprecise data.

MPC #1: The field crew will follow the SOPs in the project QAPP.

Assessment: Field audits were performed in June 2018 and August 2019 (Appendix M) to assess whether the field crew was following the SOPs. The results of the audits indicate that the field crew consistently followed the SOPs (QAPP Section 5.2).

DQI #2: Incorrectly reading instruments (e.g., survey rod) when measuring the sediment depth could result in the collection of imprecise data.

MPC #2: When the first catch basin depth is measured, the depth will be measured by two different data collectors with the same instrument. The results of the two data collectors should be consistent, or measurement procedures should be corrected until they are the consistent.

Assessment: During the first sample collection event (April 2018), two members of the field staff measured the sediment depth (duplicate measurements) in a catch basin in five different locations. Initially the duplicate measurements were inconsistent. The field staff reviewed the SOPs for measuring sediment depth and repeated the measurements. The second duplicate measurements were within a hundredth of a foot. The survey rod used to measure depth has 100th gradations and is considered accurate to within a 100th of a foot (± 0.05 feet) as such the duplicate measurements are considered consistent.

DQI #3: Duplicate analytical testing will be performed for parameters shown in Table 9.2 to verify the quality of the results.

MPC #2: If the results of the duplicate testing indicate that the relative percent difference (RPD) is $\leq 20\%$, the results of the analytical testing will be considered acceptable.

Assessment: RPD calculations were performed on the data collected with duplicate and/or triplicate measurements. The following identifies the data and provides a summary of the RPD results. Appendix O contains the detailed results from the RPD analysis.

- **Street and Catch Basin Sediment Moisture Content and Organic Matter** – Triplicate moisture content and organic matter samples were collected from each sample location (test and control sites for both street sediment and catch basin sediment). Moisture content samples were collected from each sample event and organic matter samples were collected between one to three times per year (reference Table 5.2 footnotes). The RPD for most of these measurements was greater than 20%. Results from the audit along with follow up discussion with the field crew indicate the sample collection SOPs were followed as such it is assumed that improper sample collection was not the reason for these results. Another reason may be related to the sediment characteristics which are known to influence both the moisture and organic matter content measured in samples. The characteristics of sediment on streets and in catch basin is known to be highly variable which may influence the results of these tests (USGS, 2007; Pitt, et. al., 1984; Tang, 2016). In addition, for the study location hay is known to make up a portion of the sediment composition. Considering hay can retain water, samples with a higher fraction of hay will likely have a higher moisture and organic matter content compared to samples with less hay. The RPD analysis was repeated using the three calculated dry weights for each sample event for each sample location to determine how the variance in the moisture content may influence the dry sediment weight. The RPD was less than 20% for all samples. Based on this calculation the RPD is considered acceptable.
- **Catch Basin Sock Sediment Dry Weight** – The RPD was calculated based on the duplicate measurements of the sediment dry weight after the socks were dried. Two of the sock sediment weights exceeded 20% as such they were removed from the analysis to calculate the average dry sediment weight for the data collection event.

6.3 Representativeness

DQI #1: The study operational procedures are consistent with the jurisdiction’s typical operational procedures.

MPC #1: The SOPs were developed to mimic the jurisdiction’s typical operational procedures. Data will be considered acceptable if the equipment operators are consistently following the SOPs in the project QAPP.

Assessment: Field audits were performed in June 2018 and August 2019 (Appendix M) to assess whether the field crew was performing data collection in accordance with the SOPs (QAPP Section 5.2). The results of the audits indicate that the field crew was following the SOPs and therefore was mimicking typical operational procedures for the jurisdiction.

DQI #2: Inclement weather or unusual weather could provide study results that are not representative of typical weather conditions in Ellensburg.

MPC #2: The weather during the study will be considered representative if the historical weather data is similar to the data collected at the weather station.

Assessment: Weather data was collected for the duration of the study and compared to historical weather data for Ellensburg (Section 7.3). During the study, several intense rainfall events occurred which may have affected results from specific data collection events. However, it is not possible to determine if these single events were unique compared

to historical records because most available records only include daily and monthly precipitation depths. As such an intense storm that occurred over an hour may not appear high, when compared to daily or monthly historical averages. In addition, short duration high intensity rainfall events are common for the project location (Ecology, 2019). The average precipitation for Ellensburg is 9-inches and during the study the measured precipitation was lower at 7.09-inches and 7.32-inches in 2018 and 2019 respectively. Considering stormwater runoff quantity and flow rates are known to influence sediment transport to catch basins (Tang, 2016), the sediment collected from the catch basins during the study maybe slightly lower compared to an average year.

DQI #3: Developing SOPs and following them consistently will support the representativeness of the collected samples.

MPC #3: Data will be considered acceptable if the field crew is consistently following the SOPs in the project QAPP.

Assessment: *Field audits were performed in June 2018 and August 2019 (Appendix M) to assess whether the field crew was following the SOPs. Results from the audits indicate that the field crew followed the SOPs (QAPP Section 5.2).*

6.4 Completeness

DQI #1: The sample size selected for the study is expected to provide a sufficient amount of data to support conclusions.

MPC #1: The data set is considered complete when the number of valid samples collected is equal to the sample size defined by the DQI.

Assessment: *The number of samples proposed at the beginning of the study were obtained between April 2018 and April 2020. Catch basin material depth, catch basin and street sweeping material dry weights, organic content, and particle size distribution samples were collected as defined in the QAPP during the 6-month data collection periods in 2018 and 2019. The exception was two data collection events when triplicate samples were intended to be collected to measure the moisture content and organic matter and instead the lab combined to three samples before running the test. The catch basin socks collected in April 2019 were lost in a lab fire (see Table 5.2); to replace the lost data catch basin socks were installed in October 2019 and collected in April 2020.*

DQI #2: Procedures are defined for handling missing data, coding of missing data, and reporting of missing data with results.

MPC #2: Procedures for handling missing data and coding missing data are defined in Section 11.0 of the project QAPP. The TER will include consideration for how missing data could limit the comparability of the data set.

Assessment: *The only missing data was from two data collection events when triplicate samples were intended to be collected to measure the moisture content and organic matter and instead the lab combined to three samples before running the test. Considering the*

triplicate samples were combined before testing these samples were considered acceptable an included in the data set.

6.5 Comparability

DQI #1: Define the process and provide justification for selecting the test site and control site.

MPC #1: The process for selecting the study area is defined in Section 7.2 of the project QAPP. The process focused on having a test site and control site that are equivalent.

Assessment: *Selection of the test and control sites are discussed in the project QAPP. With respect to comparing this site to other sites in Ellensburg or other locations, it will be important to consider specific site conditions that can vary by location. These conditions are detailed in Section 7.5.*

DQI #2: Consistently following SOPs for sample collection and field measurements will improve the comparability of the data within the study.

MPC #2: Data will be considered acceptable if the field crew is consistently following the SOPs in the project QAPP.

Assessment: *Field audits were performed in June 2018 and August 2019 (Appendix M) to assess whether the field crew was following the SOPs. Results from the audits indicate that the field crew followed the SOPs (QAPP Section 5.2).*

DQI #3: Defining and using standard testing methods will improve comparability of analytical data collected.

MPC #3: Data will be considered acceptable if it follows standard test methods. Standard testing methods are defined for the project in Table 9.2 of the project QAPP.

Assessment: *Standard testing methods (and the same methods) were consistently used by the analytical laboratories to test moisture content, particle size distribution, organic content, and the catch basin sock sediment dry weight.*

6.6 Sensitivity

DQI #1: Instruments capable of accurately measuring the variables of interest during the study should be used.

MPC #1: Data will be considered acceptable if instruments used are capable of measuring the different levels expected during the study.

Assessment: *The instruments used in this study (scale, survey rod, weather station, and standard analytical testing methods) are capable of measuring the different levels expected during the study.*

7.0 Results and Discussion

The goal of this study was achieved by completing the objectives outlined in Section 3.4. Each objective is noted in the subsequent section along with a summary of how the objective was achieved, the results, and discussion. The QAPP Table 9.2 defines the Standard Testing Methods for parameters tested at a laboratory and a detailed summary of the data analysis methods is in Section 14.0.

7.1 Sediment Characterization

Objective 1: Characterize the sediment collected (particle size distribution and organic content) from each sample location: on the street, in catch basins, and transferred from the catch basin (washout) at both the test site and control site.

Objective 1 was achieved by testing the particle size distribution (PSD) and organic content of sediment collected from each sample location. Results for PSD testing are first described in this section followed by the results for organic content. Appendix F and G contains the detailed results.

7.1.1 Sediment Particle Size Distribution

The sediment PSD was measured to determine the range of particle size at each sample location. Specifically, the range of particle size collected by the street sweeper, retained in catch basins, and washed out of the catch basins into the socks. Figure 7.1 and Table 7.1 provides a summary of the results from each sample location including the average PSD from the north and south side of the road, the overall average PSD (north and south combined), and the median sediment diameter (d₅₀) of the overall average PSD. A summary of the number of samples collected each year is as follows:

- Street Sediment (SS) – sediment collected by the street sweeper was tested once each year (2018 and 2019) from the north side of the road (n=2) and the south side of the road (n=2).
- Catch Basin (CB) – sediment in the catch basins, collected by the vector truck, was tested three times during the first year of the study (2018) and four time during the second year (2019). Sediment collected from all the north side catch basins was combined and tested (n=7) and sediment from all the south side catch basins was combined and tested (n=7).
- Catch Basin Socks (CBS) – sediment that washed out of the catch basins and into the socks was tested once the first year (2018), twice the second year (2019), and once in April 2020 (reference Table 5.2 footnote 7). Sediment collected from all the north side catch basin socks was combined and tested (n=4) and sediment from all the south side catch basins was combined and tested (n=4).

As shown in Figure 7.1 the largest sediment was collected from the street (d₅₀=2.0mm) followed by the sediment collected in the catch basins (d₅₀=0.8mm) with the smallest sediment washed from the catch basin into the socks (d₅₀=0.05mm). Based on the d₅₀ measurements, the sediment is classified as very fine gravel to very coarse sand (Street Sediment), coarse sand (catch basins), and silt (catch basins socks). These results are consistent with other studies which suggest that street sweepers are more efficient for picking up the larger size sediment while smaller sediment (d₅₀<0.10mm) can washout of catch basins (Elgin, 2009; Tang, 2016; Rockford et. al., 2009).

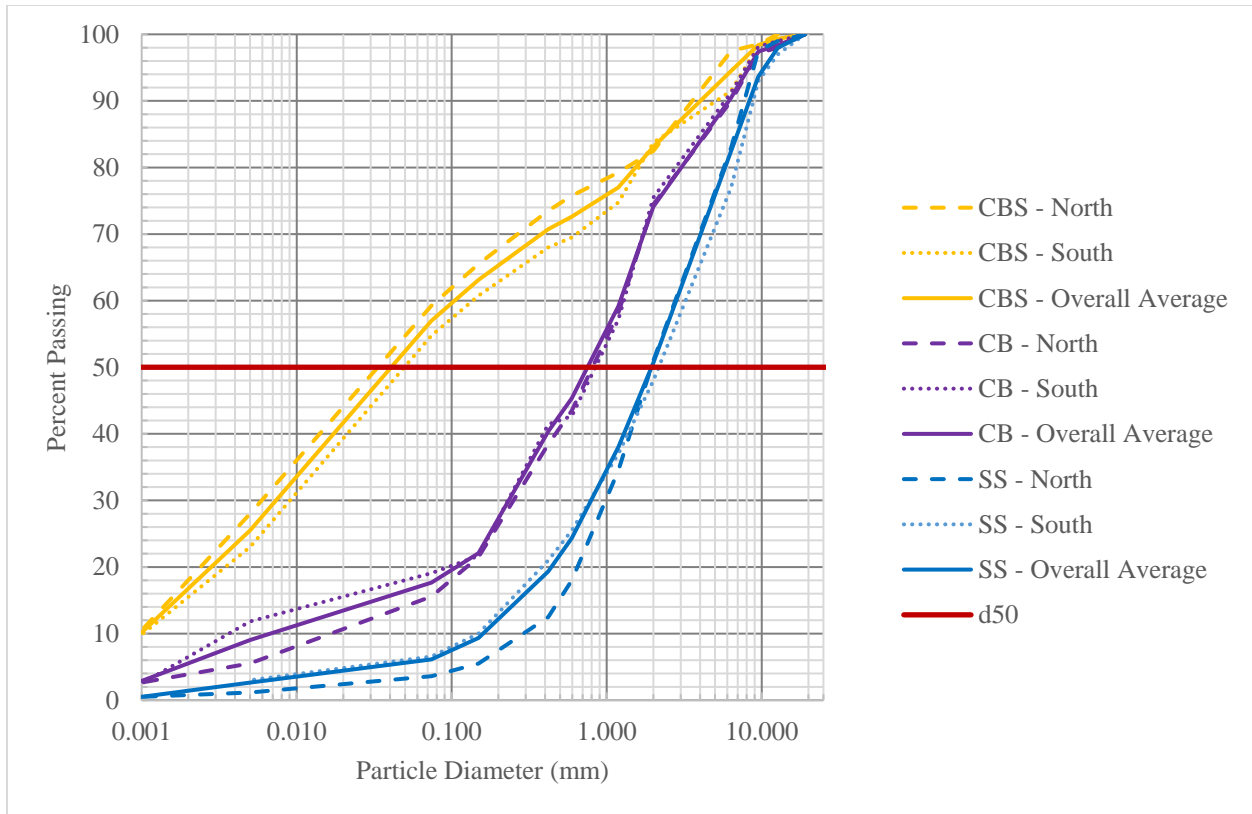

Figure 7.1 Semi Log Graph of Average Sediment PSD

Table 7.1. Summary of Average Sediment PSD by Sieve Size

Sieve Size	Particle Size (mm)	Averages (%)		
		CB n=14	SS n=4	CBS n=8

	d50 (mm)	0.8	2.0	0.05

7.1.2 Sediment Organic Content

The amount of organic content in sediment was measured as total volatile solids (TVS) in the street sediments, catch basins, and catch basin socks. Samples were collected from the street sediment on the north side (n=6) and the south side (n=3), the catch basin sediment collected on the north side (n=11) and the south side (n=11), and from the catch basin socks on the north side (n=1) and the south side (n=1). For each sample event, triplicate samples were tested except for the two sample events when triplicate samples were combined before testing and only one sample was tested (reference Section 6 for more details) and only single samples were collected from the socks due to insufficient sample size to run additional testing.

Results from the TVS testing are summarized in Figure 7.2 and Table 7.2. The organic matter in the catch basins on the south side of the road was 22.0% compared to 18.0% on the north side of the road (combined average of 20.0%). One reason the TVS was slightly higher on the south side of the road is this side is developed with landscaped strips of that are grassed areas adjacent to the road that are frequently mowed by the property owners. It is possible that grass clipping fall onto the road and into the catch basins. The north side of the road has the same landscape strip however this side is undeveloped, and the landscape areas are not maintained. The highest catch basin organic content was measured in October (Table 7.2) which could be due to an increase in hay on the roads as September and October are the primary months for hauling. However, there is insufficient data to draw meaningful conclusions regarding the seasons on the organic content variability.

The TVS of sediment in the catch basins was approximately four times higher than the sediment collected from the street (combined average of 5.2%). This may be due to the hay that builds up on the road and is washed into the catch basins during rainfall events (Figure 3.3). The organic content was highest in the socks (26.0%) however these results are from a small sample size (n=2) and collected from a single sample event (April 2020). Considering the small sample size (n=2) and that the samples were collected from a single sample event (October 2019) it is not possible to draw meaningful conclusions about the catch basin washout organic content.

Organic content results from this study were compared to other studies to assess the comparability of the results to other locations (land use). Few studies were located that reported the organic content of sediment found in streets or catch basins as a function of land use. Two studies that were located were from a Seattle Public Utilities (SPU) study that was similar to this study (SPU, 2009) and a Center for Watershed Protection (CWP) literature review that estimated pollutant removal rates for Street Sweeping and Storm Drain Cleanout Activities (CWP, 2006). Results from these studies and along with this study are summarized in Table 7.3. The street sediment organic content from this study (3.6-6.8%) was about half the content from the SPU industrial sites (9.5%) and three times lower than the residential sites (14%). The CWP study did not report organic content for street sediment. The catch basin sediment organic content from this study (9-31%) was closest to SPU residential sites (17-18%) and within the low end of the industrial sites (28-40%). The CWP catch basins sediment organic content was significantly higher reporting 59% for industrial sites. Compared to the CWP study, the catch basin sediment organic content from this study was within the range for commercial sites (28%) and slightly lower than residential sites (32%). Based on the range of reported data and limited studies reporting TVS or organic content based on land use, it is difficult to assess how the organic content measured during this study

compares to other sites based on land uses. In addition, no studies were found that reported the sediment organic content that washes out of catch basins.

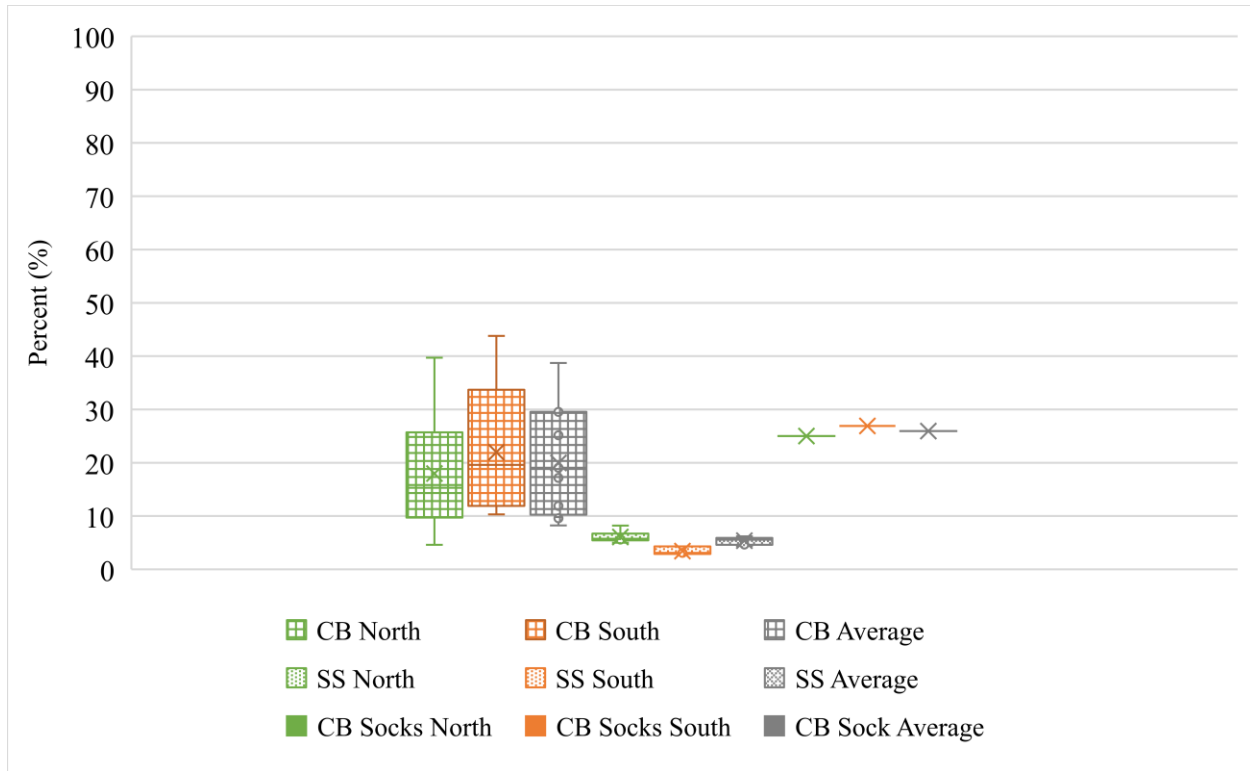

Figure 7.2 Distribution of Organic Content in Catch Basin, Street Sediment, and Catch Basin Socks

Table 7.2 Summary of Sediment Average Percent Organic Matter from Each Sample Event and Location

Sample Date	CB North n=11	CB South n=11	SS North n=6	SS South n=3	CB Socks North n=1	CB Socks South n=1

7.2 Sediment Accumulation Rate

Objective 2: Quantify the accumulation rate of sediment on the street, in catch basins, and in catch basin socks, without employing street sweeping (control site) and while employing (test site) street sweeping.

Objective 2 was achieved by calculating the sediment accumulation rate on the street, in the catch basins, and in the catch basin socks. The analysis included calculating the sediment dry weight (lbs) using the sediment wet weight (lbs) and moisture content (%) using Equations 1 and 3 from Section 14 of the QAPP. For each sample event, triplicate samples of dewatered sediment were collected and tested for moisture content (except for the two sample events when triplicate samples were combined before testing and only one sample was tested). The sediment accumulation rate was calculated from the total sediment dry weight collected since the last street sweep divided by the number of days since the last sweep. The accumulation rate was normalized to account for slight differences in the contributing basin areas to each catch basin and areas swept (Table 3.2) as well as differences in the duration between street sweeping (sample collection events) area using Equation 3 or 4 from the QAPP Section 14. The results are reported as grams/curb-mile/day for street sediment and grams/catch basin/day for catch basin and washout sediment. Results from each sample locations are summarized in the subsequent sections and detailed results are in Appendix H, I, and K.

7.2.1 Street Sweeping Sediment

The dry weights were calculated for the test side (n=8) and the control side (n=3). The average moisture content and sediment dry weight are reported for each sample event in Table 7.4 and Figure 7.3 provides a comparison of the dry weight calculated from 2018 and 2019. The first sample event occurred in April 2018, six months after both the test and control sides of the street were swept. The test side was swept four times each year (April, June, July, and August) whereas the control side was swept twice in 2018 (April and October) and once in 2019 (October). On the test side the dry weight was highest in April (six months since last sweep) and then the weight had a downward (decreasing) trend for the remaining sweep events that occurred every other month. On the control side, the dry weight was higher compared to the test side for all three events. For the October 2018 and 2019 events the frequency of street sweeping was longer (six and twelve months) compared to the test side (two months). These results consistent with other research which indicates that more frequency street sweeping reduces the quantity of sediment collected on roads (Rochfort, Q., et al., 2009).

Table 7.5 provides a summary of the average dry sediment weight collected each year from the test side and control side. As noted, the total weight of sediment collected was higher (4,648 lbs) from the control side compared to the test side (3,677 lbs) and higher on the south side (4,775 lbs) compared to the north side (3,550 lbs). This maybe because the wind primarily blows from the north west to the south east and is depositing more sediment on the south side of the road (Figure 3.1). In addition, the south side of the road is developed, and more vehicles use the driveway approaches compared to the undeveloped north side. Vehicles are known to contribute to sediment accumulation on streets from tire wear, pavement abrasion, engine break wear, etc. (Minton, 2011).

Table 7.4 Street Sediment Dry Weight Collected During Each Collection Event

Data Collection Event	Side of Road	Average Moisture Content (%) ¹	Moisture Content Standard Deviation	Sediment Dry Weight (lbs) ²
April 2018	Test	21.5	NA ³	1,450
	Control	19.5	NA ³	2,358
June 2018	Test	5.8	0.6	155
August 2018	Test	15.8	0.5	134
October 2018	Test	19.2	5.6	111
	Control	10.6	4.3	590
April 2019	Test	15.5	1.7	1,226
June 2019	Test	12.6	10.4	170
August 2019	Test	9.9	2.6	146
October 2019	Test	4.1	0.1	284
	Control	19.5	3.4	1,700

1. Average moisture content was calculated using Equation 1 from the QAPP for the study.
2. Sediment dry weight was calculated using Equation 2 from the QAPP for the study.
3. Analytical report included only composite moisture content values for the April 2018 data collection event.

Figure 7.3 Comparison of Street Sediment Dry Weight Collecting during 2018 (left) and 2019 (right)
 Note: Hatched bars indicate test side and solid bars indicate control side.

Table 7.5 Summary of Dry Sediment Weight Collected

Side of Road	2018 (lbs)	2019 (lbs)	Total (lbs)
Test	1,850	1,827	3,677
Control	2,948	1,700	4,648
North	1,850	1,700	3,550
South	2,948	1,827	4,775

The normalized accumulation rate was calculated for the same sample events as the dry weight. These results are summarized in Table 7.6 and Figure 7.4 provides a comparison of the accumulation rate from 2018 and 2019. Similar to the dry weights, the accumulation rates from the test side were highest in April, six months after the last sweep, and then the accumulation rate had a downward trend for the remaining sweep events. The control side (south) had a similar trend for 2018 however for 2019 the accumulation rate for the control side (north side) was similar to the test side despite 12 months since the last sweep compared to 2 months on the test side. These results were not as expected since the frequency of street sweeping is known to reduce the accumulation rate of sediment on roads (Rochfort, Q., et al., 2009). However, the average normalized accumulation rate over the entire study (Table 7.7) was lower on the test side (2,289 g/curb-mile/day) where sweeping occurred eight times during the study compared to the control side (4045 g/curb-mile/day) where sweeping occurred three times over the study. which was expected. These average rates are more consistent with the expected results.

Table 7.6 Street Sediment Normalized Accumulation Rate Since Last Sweep

Data Collection Event	Side of Road	Rate of Accumulation (g/d)	Normalized Accumulation Rate (g/lineal mi/d)
April 2018	Test	3,355	4,389
	Control	5,457	7,460
June 2018	Test	1,172	1,534
August 2018	Test	938	1,227
October 2018	Test	811	1,061
	Control	1,431	1,956
April 2019	Test	3,040	4,156
June 2019	Test	1,289	1,762
August 2019	Test	1,016	1,389
October 2019	Test	2,047	2,799
	Control	2,079	2,719

 Note: Hatched bars indicate test side and solid bars indicate control side.

Table 7.7 Street Sediment Average Normalized Accumulation Rate Since Last Sweep Over Study Duration

Side of Road	Average Rate of Accumulation (grams/day)	Average Normalized Accumulation (grams/curb-mile/day)
Test	1708.5	2289.5
Control	2988.8	4045.0

7.2.2 Catch Basin Sediment Weight

The dry weight of sediment collected in catch basins was calculated for the test side (n=8) and the control side (n=8) from samples collected in both 2018 and 2019. The average moisture content and sediment dry weight are reported for each sample event in Table 7.7 and Figure 7.5 provides a comparison of the dry weight calculated from 2018 and 2019. The first sample event occurred each year in April approximately six months following the last sweep and then every two months thereafter until October. For both years, the dry weight on the test side and control side was generally highest in April and then the weight had a downward (decreasing) trend for the remaining sweep events. This was expected since the first sample collection event occurred after six months of accumulation and the other events occurred after only two months of accumulation. Table 7.9 summarizes the total sediment weight collected from the test side (466 lbs) which was higher than the control side (370 lbs) as well as the total sediment weight from the north (383 lbs) and the south (453 lbs). These results are similar to the street sediment in that there is more sediment on the south side compared to the north however unlike the street sediment there was more sediment in the catch basins on the test side compared to the control side.

There are several possible reasons for these results. A property owner on the south side (test side) was observed sweeping sediment into the catch basins during March of year two. The City approached the property owner and the owner agreed to stop. During that discussion, the owner

indicated he had purchased the business since October 2018 (last sweep) and was not aware of the study. The length of road swept by the property owner plus a portion of their shared driveway was estimated to be approximately 550 feet (Figure 7.6). Another reason is that there was more sediment on the south side of the road as described in Section 7.2.1.

Table 7.7 Catch Basin Sediment Dry Weight Collected During Each Collection Event

Data Collection Event	Side of Road	Average Moisture Content (%)	Standard Deviation	Sediment Dry Weight (lbs)
April 2018	Test	27.8	NA ³	151
	Control	22.2	NA ³	131
June 2018	Test	25.9	4.8	27.0
	Control	36.3	11.6	37.0
August 2018	Test	54.4	8.1	18.3
	Control	48.9	11.7	27.7
October 2018	Test	42.7	4.5	51.0
	Control	57.0	8.3	38.2
April 2019	Test	41.8	5.0	88.1
	Control	37.5	7.2	50.2
June 2019	Test	37.8	2.4	55.9
	Control	2.6	0.7	21.5
August 2019	Test	37.4	5.6	42.9
	Control	10.4	6.1	48.0
October 2019	Test	56.0	6.9	32.1
	Control	48.9	7.2	16.1

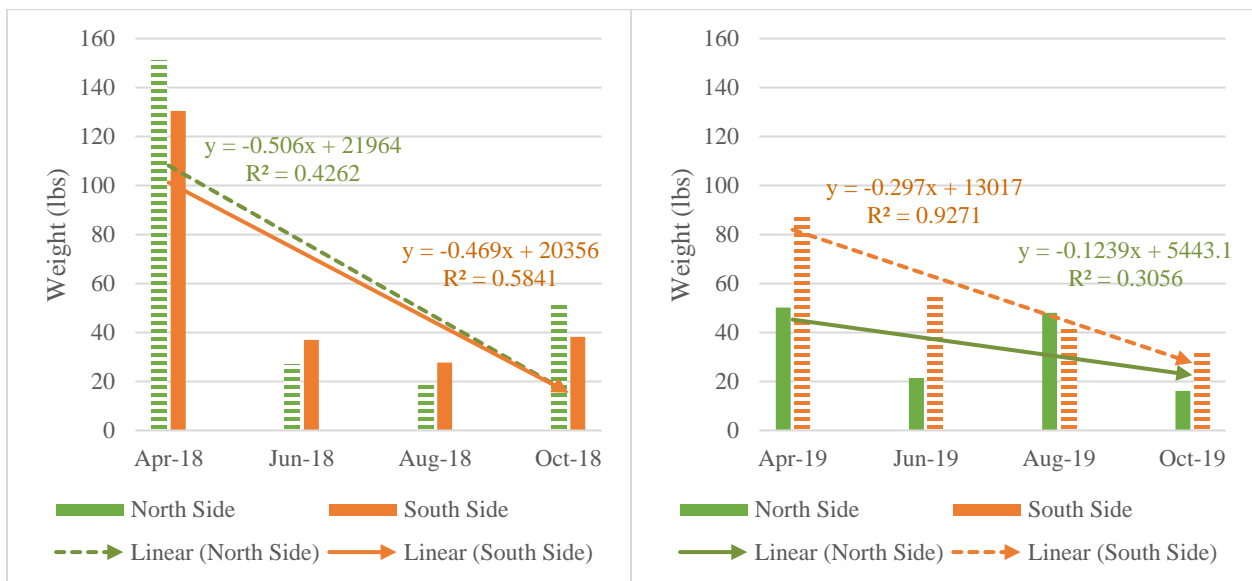

Figure 7.5 Comparison of Catch Basin Sediment Dry Weight Collecting during 2018 (left) and 2019 (right)
 Note: Hatched bars indicate test side and solid bars indicate control side.

Figure 7.6 Approximate Location of Street Swept by Property Owner

The normalized accumulation rate was calculated for the same sample events as the dry weight. These results are summarized in Table 7.8 and Figure 7.8 provides a comparison of the accumulation rate from 2018 and 2019. The accumulation rates for both the test side (2018 and 2019) and control side (2018) had a downward trend starting in April and ending in October each year. Whereas the control side during year two (2019) had an increasing trend. For the side of the road where more frequent sweeping is occurring it is anticipated that there would be a decreasing trend in the accumulation rate similar to the test side results. Conversely for the side of the road less frequent sweeping occurring it is anticipated that there would be an increasing trend in the accumulation rate similar to the control side results from 2019. The test side accumulation rate (2018) was highest in April (six months after the last sweep) and October (two months since last sweep). These results were expected for April but not October since theoretically the shorter the duration between street sweeping events the less sediment on the road that could be transferred to the catch basins. During year two (2019) the sediment accumulation rate was higher on the test side (south side) compared to the control side despite the more frequent street sweeping. One reason for these results is that there was more sediment on the south side of the road as described in Section 7.2.1.

Table 7.9 summarized the average normalized accumulation rate over the duration of the study including the average from the test side (north side in 2018 and south side in 2019) and the control side (south side for 2018 and north side for 2019). As noted, the accumulation rate was higher on the test side (16 g/CB/d) compared to the control side (11.7 g/CB/d). These results are the opposite of what was expected since more frequent street sweeping is known to reduce the accumulation rate of sediment on the streets and in theory the sediment that could be transferred to catch basins. SPU conducted a similar study and reported similar results.

Table 7.8 Catch Basin Sediment Accumulation Rate Since Last Collection Event

Data Collection Event	Side of Road	Since last street sweep		Since last CB cleaning	
		Accumulation Rate (g/d)	Normalized Accumulation Rate (g/CB/d)	Accumulation Rate (g/d)	Normalized Accumulation Rate (g/CB/d)

Table 7.9 Catch Basin Sediment Average Dry Weight and Normalized Accumulation Rate Over Study

Side of Road	Sediment Weight			Since last sweep	
	Total (lbs)	2018 (lbs)	2019 (lbs)	Average Rate of Accumulation (g/d)	Average Normalized Accumulation g/CB/d
Test	466	247	219	278	16
Control	370	234	136	208	12
North	383	247	136	207	13
South	453	234	219	280	15

7.2.3 Catch Basin Sediment Depth

The average depth of sediment accumulated in catch basins was measured for the test side (n=32) and the control side (n=32) prior to cleaning the catch basins in both 2018 and 2019. The average depth of sediment and standard deviation for each sample event is summarized in Table 7.10 and Figure 7.9 provides a comparison of the depths for 2018 and 2019. The first measurements occurred in April and then every other month thereafter until October each year. For both years, the sediment depth on the test side and control side was highest in April and then the depth had a downward (decreasing) trend for the remaining sample events. This was expected since the first sample collection event occurred after six months of accumulation and the other events occurred after only two months of accumulation. The first test side (south) depth measurement in 2019 was more than double the control side (north) despite both sides being sweep in October 2018. This maybe because of the property owner was sweeping sediment into the catch basins (Section 7.2.2).

Table 7.10 Catch Basin Sediment Depth Recorded During Each Collection Event

Data Collection Event	Side of Road	Average Depth of Sediment (in.)	Standard Deviation
April 2018	Test	3.20	0.06
	Control	3.18	0.11
June 2018	Test	0.94	0.05
	Control	1.11	0.11
August 2018	Test	0.73	0.04
	Control	0.38	0.08
October 2018	Test	0.54	0.03
	Control	0.55	0.06
April 2019	Test	3.30	0.10
	Control	1.41	0.05
June 2019	Test	0.58	0.06
	Control	0.12	0.03
August 2019	Test	0.64	0.07
	Control	0.88	0.05
October 2019	Test	0.55	0.07
	Control	0.23	0.03

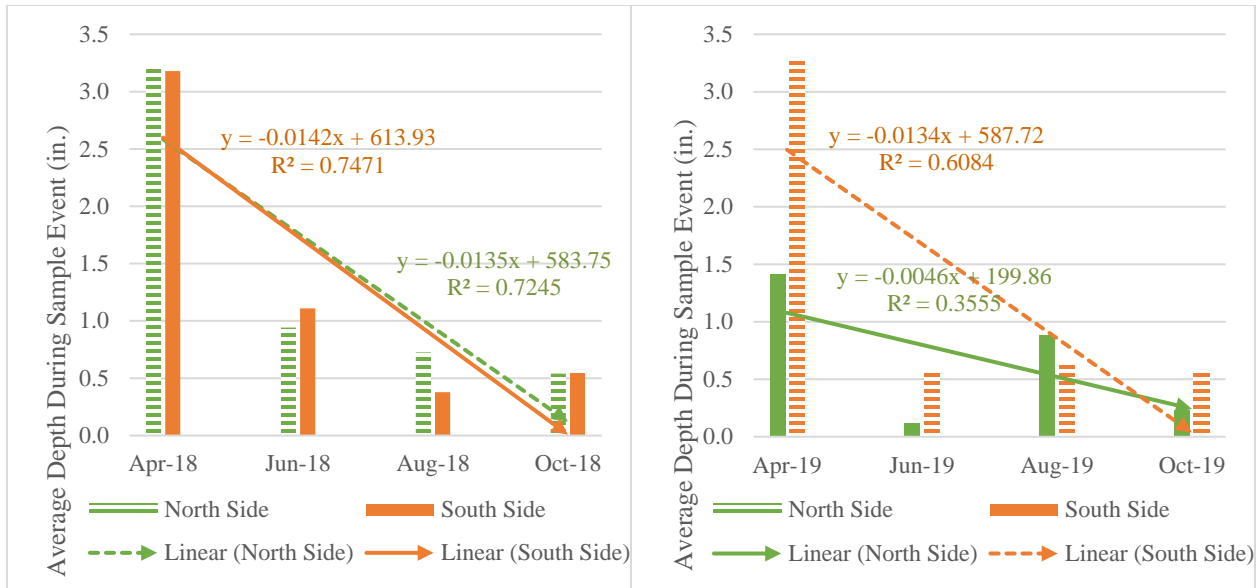

Figure 7.9 Comparison of Catch Basin Sediment Depth During 2018 (left) and 2019 (right)

Note: Hatched bars indicate test side and solid bars indicate control side.

The normalized accumulation rate was calculated for the same sample events as the depth. These results are summarized in Table 7.11 and Figure 7.10 provides a comparison of the accumulation rate from 2018 and 2019. The accumulation rates for the test side and control side (2018 and 2019) had a downward (decreasing) trend starting in April and ending in October each year. For the side of the road where more frequent sweeping is occurring it was expected that there would be a decreasing trend in the accumulation rate similar to the test side results. Conversely for the side of the road less frequent sweeping occurring it is anticipated that there would be an increasing trend in the accumulation rate which is different than the results from this study. Table 7.9 summarized the average normalized accumulation rate over the duration of the study including the average from the test side (north side in 2018 and south side in 2019) and the control side (south side for 2018 and north side for 2019). As noted, the accumulation rate was higher on the test side (0.00028 g/CB/d) compared to the control side (0.00024 g/CB/d). These results are the opposite of what was expected since more frequent street sweeping is known to reduce the accumulation rate of sediment on the streets and in theory the sediment that could be transferred to catch basins. These results are consistent with the catch basin sediment accumulation rates results described in Section 7.2.2.

Table 7.11 Catch Basin Depth Accumulation Rate Since Last Collection Event

Data Collection Event	Side of Road	Since last street sweep	Since last CB cleaning
		Normalized Accumulation Rate (in./CB/d)	Normalized Accumulation (in./CB/d)
April 2018	Test	0.00036	0.00036
	Control	0.00037	0.00037
June 2018	Test	0.00035	0.00035
	Control	0.00043	0.00043
August 2018	Test	0.00025	0.00025
	Control	0.00027	0.00013

7.2.4 Catch Basin Sock Sediment

The dry weight of sediment collected in catch basins socks was calculated for the test side (n=24) and the control side (n=25) from samples collected in both 2018 and 2019. The first sample event occurred in June (2018) and April (2019) and then every other month thereafter until October each year. For each sample event there are seven socks, four on the north and three on the south. There is one less on the south because one of the catch basins does not discharge to swale. The average sediment dry weight and standard deviation are reported for each sample event in Table 7.13 and Figure 7.11 provides a comparison of the dry weight calculated from 2018 and 2019. As noted in the Table 5.2 footnotes, the sock collected in April 2019 were lost in a laboratory fire. Socks were installed in October 2019 and removed in April 2020 that are included in this section as data from April 2019. The April 2020 socks were considered representative of the April 2019 socks since the same street sweeping and catch basin practices were followed as the previous year.

For both years, the dry weight on the test side and control side was generally highest in April and then the weight had a downward (decreasing) trend for the remaining sweep events. This was expected since the first sample collection event occurred after six months of accumulation and the other events occurred after only two months of accumulation. The one exception was from the control side in August 2019 which may be due to a high intensity rainfall event that occurred just before the sample collection event (Section 7.3). Table 7.14 summarizes the total weight collected in the socks from the test side (3696 grams) was lower compared to the control side (4078 grams) as well as the north side (3982 grams) and control side (4078 grams). These results suggest that less sediment was washed out of the catch basins on the side of the street with more frequent street sweeping.

1. Sediment dry weight was provided by the analytical laboratory, following drying of the socks in an oven.

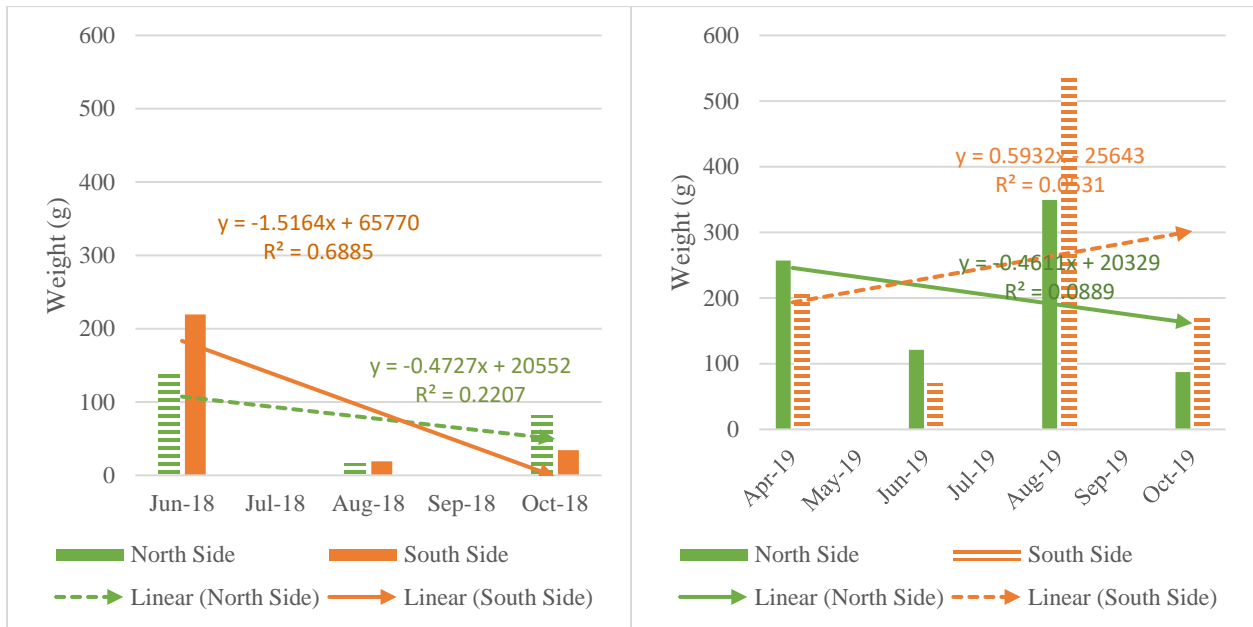

Figure 7.11 Comparison of Catch Basin Sock Sediment Dry Weight Collected in 2018 (left) and 2019 (right)
 Note: Hatched bars indicate test side and solid bars indicate control side.

The normalized accumulation rate was calculated for the same sample events as the dry weight. These results are summarized in Table 7.14 and Figure 7.12 provides a comparison of the accumulation rate from 2018 and 2019. The accumulation rates for the test side (2018) and the control side (2018 and 2019) had a downward trend starting in April and ending in October. Whereas the test side during year two (2019) had an increasing trend. If street sweeping can influence sediment washout from catch basins, the side of the road where more frequent sweeping is occurring would have a decreasing trend in the sediment accumulation rate because there is less sediment on the road that could get transferred to and potentially washed out of the catch basins. Conversely for the side of the road with less frequent sweeping occurring there would be an increasing trend in the sediment accumulation rate because there is more sediment on the road that could get transferred to and potentially washed out of the catch basins. Only the results from the 2018 test side are consistent with this theory.

Research conducted by others has reported that washout of sediment from catch basins is more likely to occur once the catch basin sump is 60% full (Tetra Tech, 2001). For this study, the maximum measured sediment depth was 3.2-inches which is lower than the 16-inch at 60% of the sump depth. No research was located that evaluated the influence of street sweeping on sediment washout from catch basins when the depth is lower than 60%. Considering the mixed results from this study, the low sediment depth in the catch basins, and no other studies for comparison, more research is needed to determine if street sweeping can influence the rate of sediment washout from catch basins.

Other factors may influence of the washout of sediment from catch basins. Research conducted by others indicates that the density and particle size distributions most affect the transport of the solids in stormwater. Larger particles in storm water tend to settle out (on the road or in catch basins), whereas smaller particles remain suspended in storm water and can be washed out (Characklis & Wiesner, 1997). Hydraulics can also influence sediment transport for example a high intensity rainfall events has a higher force compared to a rainfall event with the same depth that occurred over a longer duration) for moving larger and more sediment (Minton, 2011). This may explain the highest sediment weight and accumulation rate which was measured in August 2019 following a high intensity event in Ellensburg (Section 7.3).

Table 7.9 summarized the average normalized accumulation rate over the duration of the study including the average from the test side (north side in 2018 and south side in 2019) and the control side (south side for 2018 and north side for 2019). As noted, the accumulation rate was higher on the test side (0.64 g/CB/d) compared to the control side (0.40 g/CB/d). These results are consistent with the catch basin sediment dry weight accumulation rates in catch basins (Section 7.2.2) and the sediment depth accumulation rate (Section 7.2.3) on the test and control side. The higher rate of washout from the test side maybe due to a higher quantity of sediment in the catch basins on the test side.

7.3 Weather Data

Objective 3: Identify potential weather-related methods of sediment transport to the road, catch basin, and catch basin socks and assess representativeness of the climate conditions during the study (compared to historical records)

Objective 3 was achieved by collecting and evaluating weather data (precipitation and wind) from a weather station (Section 5.2.1) near the test site. Appendix L contains a copy of the raw weather data. This section provides a summary of the data along with discussion regarding the weather during the study, specifically representativeness (compared to historical weather in Ellensburg) and the potential influence on sediment transport.

7.3.1 Representativeness of Weather During the Study

The historical precipitation depth by month is shown in Figures 7.13-7.15 along with the precipitation depth measured during this study. These precipitation depths include the measured rainfall depths as well as the rainfall equivalent depth of snow fall. The historical precipitation depth for Ellensburg is 9-inches and during this study the measured precipitation depth was slightly lower at 7.09-inches and 7.32-inches. Runoff from precipitation is known to transport sediment to catch basins particularly solids less than 0.25 mm (Fan, 2004; Tang, 2016). Based on the monthly averages during the study, it is anticipated that there was slightly less sediment transported to the catch basins during this study compared to a typical year with historical precipitation depths.

The historical wind speed (average and maximum monthly) in Ellensburg is shown Table 7.15 and Figures 7.13-7.15 along with the measured values during this study. The average wind speed measured (April 2018 to April 2020) was slightly lower compared to historical (4.8 mph compared to 9.0 mph) however the average maximum wind speed was about the same (15.1 compared to 15.5 mph). Wind is known to convey sediment into catch basins (solids less than 5 mm) and even influence sediment washout (smaller solids) from catch basins (Fan, 2004). The lower average wind speed may have reduced the transport of sediment to catch basins.

	Wind Speed (mph)			
	Year 1	Year 2	Overall	Historical
Average	4.4	5.3	4.8	9.0
Maximum	13.6	16.5	15.1	15.5

7.3.2 Potential Influence of Weather on Study Results

The measured precipitation data and maximum wind speed were compared to the data from the sample collection events to assess the potential influence of precipitation and wind on the sediment accumulation rate. Figure 7.19 displays the cumulative precipitation depth since the last catch basin cleaning compared to the sediment depth measured in the catch basins. As shown higher precipitation depth are generally associated with higher sediment depths. These results suggest precipitation events likely influenced the transport of sediment to catch basins. One exception is the August 2018 sample collection event when there was only 0.01-inches of rainfall since the last catch basin cleaning but there was still a measurable depth of sediment in the catch basins. Since wind is known to transfer sediment to catch basins, and the wind speed is highest in Ellensburg during the dry season (Figure 7.20), wind likely contributes to sediment transport to the catch basins. This further support the theory previously mentioned regarding wind being responsible for higher sediment loads on the south side of the road were compared to the north side (wind blows from the north west to the south east). Figure 7.20 displays the average monthly maximum wind speed compared to the sediment depth measured in the catch basins.

Sediment movement in urban areas to storm sewer systems can occur through wind and stormwater runoff. Reportedly wind can transport solids less 5 mm in size whereas solids in runoff are typically less than 0.25 mm (Fan, 2004). Limited research was located on regarding wind transporting solids to catch basins and into the storm drain system. As such it is not possible to estimate the fraction of sediment transported to catch basins compared to transport via runoff beyond what has been discussed and can be observed in Figures 7.19 and 7.20. Sediment transport through runoff is well documented and a complicated process. Sediment wash off from imperious surfaces is influenced by the rainfall energy, rainfall intensity, runoff volume, and surface characteristics such as topography. For sediment that has collected on roadway surfaces, sediment transport occurs after the runoff energy (velocity of runoff) exceed the critical shear stress of solids (Yang, 2016; Navickis-Brasch, 2011). For high intensity rainfall events, sediment transport is more likely to occur compared to long duration rainfall events with the same precipitation depth because runoff has less energy. This may explain why the sediment depth was higher compared to the cumulative precipitation in August 2019 (Figure 7.20 and 7.22). A few weeks prior to the August 2019 sample collection event, a high intensity rainfall event occurred (0.35 in. in one day). This high intensity rainfall event may also explain why the catch basin sock accumulation rate was highest in August 2019. Figures 7.20 to 7.22 displays the measured monthly precipitation depth along with the daily precipitation depth and the days sample collection occurred.

7.4 Statistical Comparison of Datasets

Objective 4: Determine whether there is a statistically significant difference between the sediment accumulation rate in the catch basins and in the catch basin socks (washout from the catch basin) at the test site compared to the control site

Objective 4 was achieved by conducting a statistical analysis to assess whether there was a significant difference in the sediment accumulation rate between datasets. This included evaluating whether the data was normally distributed using the Ryan-Joiner test (similar to Shapiro-Wilk test) (Helsel & Hirsch, 2002). Normality was assumed if the tests produced a p-value greater than 0.05 (Ecology, 2008). If the data was normally distributed, a two-sample t-test was used to determine if there was a significant difference between the sediment accumulation at the test site and the control site. If the data was non-normally distributed, a Wilcoxon rank sum test (a nonparametric analogue to the paired t-test) was used instead. The specific null hypothesis (H_0) and alternative hypothesis (H_a) that were evaluated is defined below. The statistical comparison will be based on a confidence level of 95% ($\alpha=0.05$). Appendix P contains the full results from the normality and statistical analysis.

Hypothesis 1:

- H_0 : The sediment accumulation rate on the street during year one at the test site is equal to the sediment accumulation rate on the street at the test site during year two
- H_a : The sediment accumulation rate on the street during year one at the test site is not equal to the sediment accumulation rate on the street at the test site during year two

Hypothesis 2:

- Ho: The sediment accumulation rate in the catch basins at the test site is equal to the sediment accumulation in the catch basins at the control site
- Ha: The sediment accumulation rate in the catch basins at the test site is not equal to the sediment accumulation in the catch basins at the control site

Hypothesis 3:

- Ho: The sediment accumulation rate in the catch basin socks at the test site is equal to the sediment accumulation in the catch basin socks at the control site
- Ha: The sediment accumulation rate in the catch basin socks at the test site is not equal to the sediment accumulation in the catch basin socks at the control site

7.4.1 Hypothesis 1: Street Sediment Accumulation Rate

Both a two-sample t-test and the Wilcoxon rank sum test were used to assess the significant difference in the street sediment accumulation rate between on the test side between year one (n=4) and year two (n=4). This is because the results of the normality testing indicate the data collected from year one was non-normally distributed ($p < 0.05$) whereas the data collected from year two was normally distributed ($p > 0.05$). Results from the t-test and Wilcoxon test indicate that the difference in the street sediment accumulation rate between the two years was statistically insignificant ($p = 0.656$ and $p = 0.47$ respectively). These results suggest that the distribution of street sediment between the test side during year one (average 2,053 g/lineal-mile/day) was equivalent (statistically insignificant) compared to the test side during year two (average 2527 g/lineal-mile/day).

7.4.2 Hypothesis 2: Catch Basin Sediment Accumulation Rate

A two-sample t-test was used to assess the significant difference in the catch basin sediment accumulation rate between the test and control side. This is because the results of the normality testing indicate the data collected from both sides was normally distributed ($p > 0.05$). Results from the t-test indicate that the difference in the catch basin sediment accumulation rate between the test side (average 16.0 grams/catch basin/day) and control side (11.7 grams/catch basin/day) was statistically insignificant ($p = 0.095$). These results suggest that the frequency of street sweeping did not influence the accumulation of sediment in the catch basins.

7.4.3 Hypothesis 3: Catch Basin Sock Sediment Accumulation Rate

A two-sample t-test was used to assess the significant difference in the catch basin sock sediment accumulation rate between the test (n=6) and control side (n=7). This is because the results of the normality testing indicate the data collected from the test side was normally distributed ($p > 0.05$). Results from the t-test indicate that the difference in the catch basin sock sediment accumulation rate between the test side (average 0.64 grams/sock/day) and control side (average 0.40 grams/sock/day) is statistically insignificant ($p = 0.961$). These results suggest that the frequency of street sweeping did not influence sediment accumulation that washed out of the catch basins socks.

Note: the sample size is not the same because one data point was removed after running the Grubb's Test and being identified as an outlier. Reference Appendix P for the outlier results.

8.0 Recommendations and Transferability

Data collected from the study was used to recommend a combination of street sweeping and catch basin cleaning procedures for achieving permit requirements for catch basin cleaning. Section 8.1 provides a summary of the recommendations and the process used to develop the recommendations. Section 8.2 provides an overview and discussion regarding the variables that may influence the transferability of the recommendations to other sites.

8.0 Relationship between Street Sweeping and Catch Basin Cleaning

Objective 5: Evaluate whether there is a correlation (using a regression analysis) between catch basin sediment accumulation rates and street sweeping frequency that could be used to develop a schedule for catch basin cleaning and provide recommendations for applying the results.

Objective 5 was achieved by using data collected from the study to develop a relationship between street sweeping frequency and catch basin cleaning. Results from the analysis are shown in Figure 8.1 and the analysis methods are described in later in this section. The x-axis is the frequency of street sweeping each year that occurs at regular intervals during the dry season. The y-axis is the recommended schedule for cleaning catch basins which is based on the estimated time it would take for sediment to fill 60% of the catch basin sump. A linear least squares regression analysis was used to evaluate the relationship between street sweeping frequency and the time it would take for the catch basin sump to fill (60% full) and the results indicate a strong linear correlation ($R^2=0.9354$). An example of how Figure 8.1 could be used is if the City decides to sweep four times per year, it is estimated that the catch basins would need to be cleaned every ~7.5 years. These recommendations are specific to the site where the study was conducted. Section 8.2 provides a discussion regarding the transferability of this information to other locations.

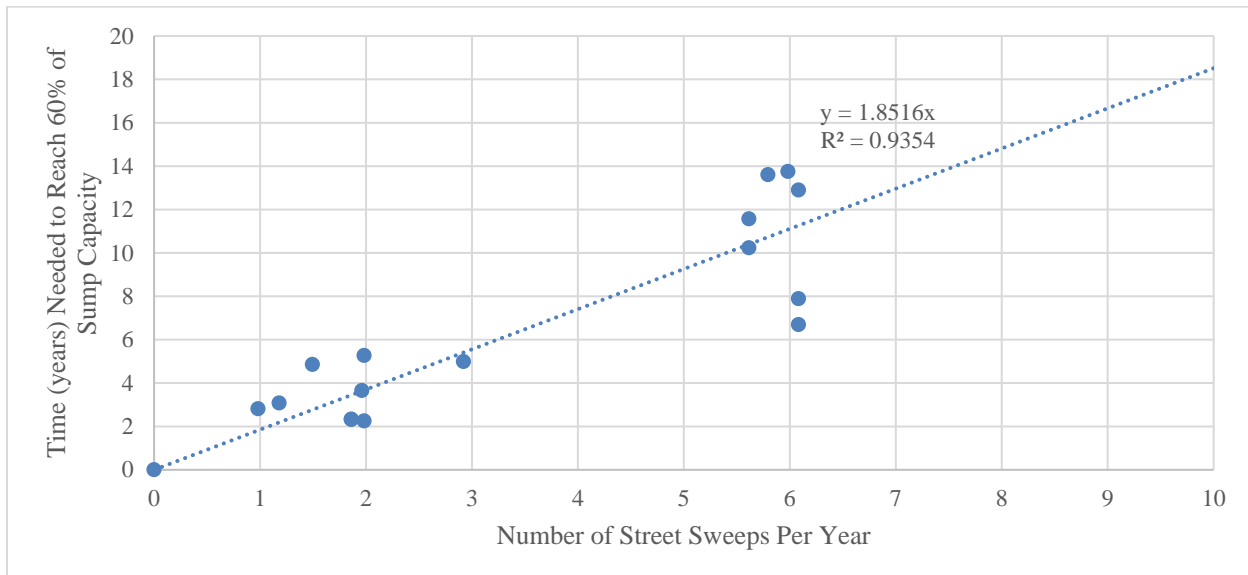

Figure 8.1 Recommend Catch Basin Cleaning Frequency based on Frequency of Street Sweeping

The process of developing the graph is as follows:

- The depth of sediment measured in the catch basins was graphed against the weight of sediment collected during each sample collection event from both the test side and control side. A correlation between the data points was established using a linear least squares regression (trendline equation on Figure 8.1). A few outliers were identified using Grubbs Test and removed.
- The sediment depth vs weight (trendline) equation was used to estimate the dry weight (139 lbs) when the catch basin would be 60% of the sump depth. These results were considered conservative since the density of the sediment will increase as the sediment depth increases due to the weight of the sediment.
- The bulk density of sediment collected from the catch basins (n=6) in October 2019 was measured at 80% compaction (36.83 lb/ft³). No studies were found that report catch basin sediment density at varying depths, so the compaction was estimated from related studies. Specifically, the average compaction of dry sand that is poured into a container is 85% (Muszynski, 2006). The catch basin sediment from this study has a 20% organic content and bulk density reportedly decreases as the organic content increases (Avnimelech, Y., Ritvo, G., Meijer, L. E., & Kochba, M., 2001). Considering that, compaction was adjusted to 65% to estimate the sediment density in the catch basins (29.9 lb/ft³) at 60% full.
- The weight of the sediment at 60% sump depth (289 lbs) was calculated from the catch basin sump volume at 60% full (5.5cft) times the assumed density (27.6 lb/ft³). Considering the weight calculated from the bulk design at 60% compaction is twice the weight using the trendline equation (289 lbs compared to 139 lbs), the trendline equation method appears to be conservative providing a factor of safety of approximately 2.
- For each sample collection event, the average weight of sediment measured in the catch basin was divided by the estimated weight at 60% full using the trendline equation (139 lbs) to estimate how many years it would take to fill the catch basin to 60% the sump depth. The number of years to fill was plotted vs the number of sweeps per year that occurred when that sample was collected (Figure 8.1).

Figure 8.11 Catch Basin Sediment Depth vs. Catch Basin Sediment Weight

8.2 Considerations for Transferability of Recommendations

Figure 8.1 is intended to provide the City of Ellensburg with recommendations for scheduling catch basin cleaning based on the frequency of street sweeping. These recommendations are specific to the site where the study was conducted. A literature review was conducted to identify site specific conditions (variables) that may influence the transferability of these recommendations. If the Figure 8.1 recommendations are considered for a different site, then the cumulative impact of all the conditions described in this section should be evaluated to develop modified recommendations for that specific site.

Sediment accumulation rates in catch basins are influenced by many variables. These variables include land use and traffic volumes; weather (rainfall energy, rainfall intensity, runoff volume, wind); topography; particle size; whether or not street parking is permitted; and the presence of trees; and winter maintenance practices (Tang, 2016; Milesi, 2013; Minton, 2011; Tan, 2006; Caraco et al., 2000). The remainder of the section provides a summary of these variables along with discussion regarding how the presence of these variables may influence the transferability of this studies results to another site:

- **Land Use** – Multiple research studies have reported significantly different sediment accumulation rates based on land use. Industrial areas reportedly have the highest accumulation rates compared to commercial or residential areas (Milesi, 2013; Minton, 2011; Stein, 2006; Maestre & Pitt, 2007). Conflicting results were reported with commercial and residential areas with some studies reporting higher accumulation rates in residential areas (Stein, 2006) whereas other studies reported higher accumulation rates in commercial areas (Maestre & Pitt, 2007). One reason for the differences is more frequent street sweeping may occur in some commercial areas by property owners (compared to residential or industrial areas) that are not reported in the literature (Minton, 2012). Another reason is some studies report results for all residential land use designations combined whereas other studies provide more detailed categories such as low density (one dwelling unit per acre) and high density (sixteen dwellings units per acre). Reportedly low-density residential designations have higher sediment accumulation rates compared to high density residential (Barret, 1996; Stein, 2006) and heavily traveled commercial streets have two to three times higher accumulation rates compared to high density residential (Milesi, 2013). Before distinguishing potential differences in sediment accumulation rates between commercial and residential areas, a more detailed literature search is needed to evaluate the variables that may influence these differences. *Transferability Consideration: The test site for this study is located in a light industrial area and sediment accumulation rates are likely higher compared to commercial or residential areas. As such the frequency of street sweeping and/or catch basin cleaning could be reduced compared to Figure 8.1 recommendations for roads in residential or commercial as it would likely take longer for the catch basins to reach 60% full.*
- **Traffic Volumes** – Conflicting results have been reported with respect to the influence of traffic volumes on sediment accumulation rates. Researchers have reported that sediment accumulation rates increase with traffic volumes for average daily traffic (ADT) counts between 4,500 to 20,000 (Viklander, 1998; zero to 50,000 (Shaheen, 1975), and up to 30,000 (Strecker et al., 1990). Whereas a four-year study conducted by CalTrans at 83 sites with varying ADTs (2,600 to 328,000) found that sediment accumulation rates (n=809) for

non-urban roads (ADT<30,000) were more the twice urban roads (ADT>30,000). In the same study that researcher indicated they reviewed several studies and found that all reported no or weak correlations between ADT and sediment accumulation rates (Kayhanian, 2003). *The reported ADT for this study is 4,000. For sites with ADTs 30,000 or less, there may be an increase in sediment accumulation rates as ADT increases. As such for sites with ADTs higher than 4,000 the frequency of street sweeping and/or catch basin cleaning should be increased compared to Figure 8.1 recommendations to account for additional sediment accumulation.* However, a more detailed review of literature is recommended to better understand the relationship between ADT and sediment accumulation rates. Results from the literature search could be used to expand the Figure 8.1 recommendations to include ADT.

- **Topography** - The test site for this study had a relatively flat topography (3%). Runoff energy tends to increase as the site slope increases, transporting more sediment to catch basins. *For sites with higher slopes (>3%), the frequency of street sweeping and/or catch basin cleaning should be increased compared to Figure 8.1 recommendations to account for additional sediment accumulation. Conversely sites with lower slopes (<3%) may be able to use a decreased frequency.*
- **Wind** - Wind can influence the quantity of sediment transported to catch basins (Section 7.3). The average and maximum historical wind speed at the study site was 9.0 mph and 15.5 mph respectively. *For sites with lower average wind speeds, the Figure 8.1 recommendations may be conservative and the frequency of street sweeping and/or catch basin cleaning could be reduced. A more detailed literature search or research is needed to better understand the relationship between wind speed and the fraction of sediment (by particle size) that is transported to catch basins.*
- **Rainfall Characteristics** – Rainfall intensity and volume can influence the rainfall energy available to transport sediment to catch basins. The mean annual precipitation (MAP) in Ellensburg is 9-inches of which an average of 3-inches occurs during the dry season (Section 7.3.1). In addition, short duration high intensity rainfall events are common during the dry season (Section 3.2). *For sites with higher MAP the frequency of street sweeping and/or catch basin cleaning in Figure 8.1 should be increased to account for potentially higher sediment accumulation rates.*
- **Sediment Particle Size** - The sediment PSD can influence sediment transport via runoff and wind. Before applying these results to other locations, PSD on the streets should be tested and compared to the data in Section 7.1.1. *If the d50 is larger than it was for this study, the recommendations in Figure 8.1 maybe conservative as it will take more energy (from wind or runoff) to transfer sediment. Conversely, if the d50 is smaller the recommendations may need to be adjusted to include more frequent street sweeping and/or catch basin cleaning because it will take less energy to transfer sediment to catch basins.*
- **Sediment Organic Content** - The organic content of sediment in catch basins can influence the sediment bulk density and subsequently the time it will take the catch basin to fill 60% of the sump. Specifically, the higher the organic content, the lower the bulk density of sediment in catch basins. The test site for this study was is a major hay hauling route which may have influenced the catch basin organic content (20%). *If the organic content is higher at a site compared to this study the bulk density will be lower than this study and the recommended frequency of street sweeping and catch basin cleaning may need to be increased (weight to fill catch basin would be less).* There was limited research

located that provided a range of TVS or organic content based on land use, as such it is difficult to assess how the organic content measured during this study compares to similar land uses. In addition, no studies were found that reported the sediment organic content that washes out of catch basins. Future research is recommended to identify a range of organic contents based on land use or test the organic content at specific sites before applying the results from this study.

- **Street Parking** – Street parking can influence the street sweepers effectiveness for reducing sediment accumulation especially in locations that are known to problems with people not moving their vehicle when sweeping is scheduled. The study site did not permit vehicles to park on the street at any time. *If street parking is permitted at a site the there the recommended frequency of street sweeping and catch basin cleaning should be increased.*
- **Trees** - Leaves and pine needles that fall onto streets and are not immediately cleared are known to clog storm drains and also contribute to sediment accumulation rates. This study was conducted on a street without trees. *If the deciduous or evergreen trees are present at a site the recommended frequency of street sweeping and catch basin cleaning should be increased during the season leaf or pine needle fall is expected.*
- **Winter Maintenance Practices** – In cold climate locations, sediment accumulation rates may be higher if winter maintenance practices include applying sand to roads. The test site for this study did not include applying sand. *If the sand is applied at a site the recommended frequency of street sweeping and catch basin cleaning should be increased.*

9.0 Conclusion

Objective 6: Summarize the study results. This objective was achieved by summarizing the results in this section.

The goal of this study was to determine whether the frequency of street sweeping significantly reduces the rate of sediment accumulation in catch basins (and transported from catch basins) during the dry season in a semi-arid location. While there was generally a decreasing trend in the sediment accumulation rate in catch basins and catch basin socks (washout) as the frequency of street sweeping increased, the differences between the test side and control side were statistically insignificant. These results suggest that frequency of street sweeping performed within this study does not significantly reduce the rate of sediment accumulation in catch basins (and transported from catch basins). However, that does not mean that more frequent street sweeping does not have a significant effect on catch basin sediment accumulation rates. It just means the results from this study did not prove a significant difference.

Similar street sweeping and catch basin studies have been conducted and many researchers have reported results similar to this study noting that extreme variability in site conditions can influence the results such as wind, sediment loading, rainfall patterns, etc. (SPU, 2009; USGS, 2007; CWP, 2006; Caraco, 2000). For example, a high intensity rainfall event right before sample collection (reference August 2019 on Figure 7.22) can influence the results for a study with a small sample size like this study. One approach to control some variability might be to design a similar study except that street sweeping would occur right before rainfall events. This could eliminate some of the rainfall variability however it would be challenging because the street sweeping schedule would be based on the weather forecast which is not always accurate. In addition, this type of approach does not reflect world conditions. Another approach for studies with high variability is to collect significantly more data which is needed to detect significant differences from street sweeping (USGS, 2007; CWP, 2006; Kalinosky, et.al; 2014).

More frequent street sweeping during the dry season should be more effective in semi-arid regions that have distinct wet and dry seasons (Caraco, 2000). Low annual rainfall, droughts, high evaporation rates, and high intensity rainfall events are all characteristics of semi-arid locations. Ellensburg's mean annual precipitation is 9-inches of which 25% is from snow (22-inches) and 67% of the precipitation occurs between October and March. During the dry season (April to October) in a semi-arid location such as Ellensburg, rainfall events are less frequent and may not produce enough runoff energy to transfer a significant amount of sediment to catch basins unless there is a high intensity rainfall event. As such more frequent sweeping throughout the drier season can reduce the sediment accumulation on roads, which will reduce the sediment that could be transferred catch basins during the wet season (Caraco, 2000).

Narrative

Receipt

The samples were received on 5/2/2018 10:55 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.6° C.

Receipt Exceptions

The Chain of Custody was received without any analyses selected. The samples were logged in per the sample IDs and confirmed by the client.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Geotechnical

Method D422: The following samples contained large amounts of grass: Basin 1 (590-8467-1) and Basin 3 (590-8467-3). This method was not designed for these types of samples therefore data may be considered as estimates only. Hydrometer was not able to float freely to give accurate reading. Root balls do not break up with the roto-taper and may hold onto smaller grain sizes.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Geotechnical

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

COOLER RECEIPT FORM

590-8467 Chain of Custody

Cooler Received/Opened On 05-03-2018 @ 09:20

Time Samples Removed From Cooler 1501 Time Samples Placed In Storage 1503 (2 Hour Window)

1. Tracking # 5001 (last 4 digits, FedEx) Courier: FedEx
IR Gun ID 31470368 pH Strip Lot NA Chlorine Strip Lot NA

2. Temperature of rep. sample or temp blank when opened: 4.3 Degrees Celsius

3. If Item #2 temperature is 0°C or less, was the representative sample or temp blank frozen? YES NO NA

4. Were custody seals on outside of cooler? YES...NO...NA NA

If yes, how many and where: 1 (front) + 1 (rear)

5. Were the seals intact, signed, and dated correctly? YES...NO...NA NA

6. Were custody papers inside cooler? YES...NO...NA NA

I certify that I opened the cooler and answered questions 1-6 (initial) GH

7. Were custody seals on containers: YES NO and Intact YES...NO...NA

Were these signed and dated correctly? YES...NO...NA NA

8. Packing mat'l used? Bubblewrap Plastic bag Peanuts Vermiculite Foam Insert Paper Other None

9. Cooling process: Ice Ice-pack Ice (direct contact) Dry ice Other None

10. Did all containers arrive in good condition (unbroken)? YES...NO...NA NA

11. Were all container labels complete (#, date, signed, pres., etc)? YES...NO...NA NA

12. Did all container labels and tags agree with custody papers? YES...NO...NA NA

13a. Were VOA vials received? YES...NO...NA NA

b. Was there any observable headspace present in any VOA vial? YES...NO...NA NA

14. Was there a Trip Blank in this cooler? YES...NO...NA NO If multiple coolers, sequence # _____

I certify that I unloaded the cooler and answered questions 7-14 (initial) GH

15a. On pres'd bottles, did pH test strips suggest preservation reached the correct pH level? YES...NO...NA NA

b. Did the bottle labels indicate that the correct preservatives were used YES...NO...NA NA

16. Was residual chlorine present? YES...NO...NA NA

I certify that I checked for chlorine and pH as per SOP and answered questions 15-16 (initial) GH

17. Were custody papers properly filled out (ink, signed, etc)? YES...NO...NA NA

18. Did you sign the custody papers in the appropriate place? YES...NO...NA NA

19. Were correct containers used for the analysis requested? YES...NO...NA NA

20. Was sufficient amount of sample sent in each container? YES...NO...NA NA

I certify that I entered this project into LIMS and answered questions 17-20 (initial) GH

I certify that I attached a label with the unique LIMS number to each container (initial) GH

21. Were there Non-Conformance issues at login? YES...NO...NA NO Was a NCM generated? YES...NO...NA NO

Question	Answer	Comment
Radioactivity wasn't checked or is \leq background as measured by a survey meter.	N/A	Lab does not accept radioactive samples.
The cooler's custody seal, if present, is intact.	True	#214681,214680
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	Not listed on COC
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

Narrative

Receipt

The samples were received on 5/2/2018 10:55 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.6° C.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

Geotechnical

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

SAMPLE CONDITION RECORD

Samples received in a cooler?	No
Samples received intact?	Yes
What is the temperature of the sample(s)? (°C)	27.1/27.2
Samples received with a COC?	Yes
Samples received within holding time?	Yes
Are all sample bottles properly preserved?	Yes
Labels and chain agree?	Yes
Total number of containers?	7

Project Number L18532

PROJECT: City of Ellensburg QAPP

**SUBJECT: Results of Laboratory Testing
Report #2**

At your request, we provided laboratory testing services for the subject project. Services were limited to the performance of testing of laboratory tests, selected at your discretion.

For this period, our involvement was limited to laboratory testing of three two delivered to our laboratory on September 14, 2018. Laboratory tests were conducted in general accordance with methods listed on the attached Laboratory *Summary* sheet.

If you have questions regarding this report, please call.

Respectfully Submitted,
Budinger & Associates, Inc.

Terri Ballard
Laboratory Manager

The results reported relate only to the samples indicated.
Soil/solid results are reported on a dry-weight basis unless otherwise noted.

Sample Extraction Logbook

%Moisture instructions: Determine the percent moisture for each solid sample by oven drying about 10.0g of sample at 105°C for 2 hours. Allow to cool in a dessicator and re-weigh. Oven dry for an additional 30 minutes and re-weigh. Further drying is necessary if the two weighings differ by more than 1%.

This report shall not be reproduced except in full, without the written approval of the laboratory.
The results reported relate only to the samples indicated.
Soil/solid results are reported on a dry-weight basis unless otherwise noted.

Sample Extraction Logbook

%Moisture instructions: Determine the percent moisture for each solid sample by oven drying about 10.0g of sample at 105°C for 2 hours. Allow to cool in a desiccator and re-weigh. Oven dry for an additional 30 minutes and re-weigh. Further drying is necessary if the two weighings differ by more than 1%.

Lab Sample ID	Dish ID	Dish wt (g)	Dish + wet (g)	Dry 1 (g)	Dry 2 (g)	% moisture	Sample Weight (g)	Method	Balance	Date/Time	Initials

PROJECT: Anatek 2019 Materials

**SUBJECT: Results of Laboratory Testing
Report #2**

At your request, we provided laboratory testing services for the subject project. Services were limited to the performance of testing of laboratory tests, selected at your discretion.

For this period, our involvement was limited to laboratory testing of two sample delivered to our laboratory on May 16, 2019. Laboratory tests were conducted in general accordance with methods listed on the attached *Laboratory Summary* sheet.

If you have questions regarding this report, please call.

Respectfully Submitted,
Budinger & Associates, Inc.

Terri Ballard
Laboratory Manager

Please send a copy of the results to Jon at email above and Aimee at aimeen@osbornconsulting.com

SWBS

For ASTM D422 testing, combine all 042519CBTS samples, then combine all 042519CBCS samples and use the following sieve sizes:
 >2mm, 0.25-2mm, 0.075-0.25mm, <0.075 mm

For ASTM D2974 testing, combine all CBTS samples, then combine all CBCS samples.

Sample Extraction Logbook

%Moisture instructions: Determine the percent moisture for each solid sample by oven drying about 10.0g of sample at 105°C for 2 hours. Allow to cool in a dessicator and re-weigh. Oven dry for an additional 30 minutes and re-weigh. Further drying is necessary if the two weighings differ by more than 1%.

PROJECT: Anatek 2019 Materials

**SUBJECT: Results of Laboratory Testing
Report #4**

At your request, we provided laboratory testing services for the subject project. Services were limited to the performance of testing of laboratory tests, selected at your discretion.

For this period, our involvement was limited to laboratory testing of two samples delivered to our laboratory on September 18, 2019. Laboratory tests were conducted in general accordance with methods listed on the attached *Laboratory Summary* sheet.

If you have questions regarding this report, please call.

Respectfully Submitted,
Budinger & Associates, Inc.

Terri Ballard
Laboratory Manager

SAMPLE CONDITION RECORD

Samples received in a cooler?	No
Samples received intact?	Yes
Samples received with a COC?	Yes
Samples received within holding time?	Yes
Are all sample bottles properly preserved?	Yes
Labels and chain agree?	Yes
Total number of containers?	7

Sample Extraction Logbook

%Moisture instructions: Determine the percent moisture for each solid sample by oven drying about 10.0g of sample at 105°C for 2 hours. Allow to cool in a dessicator and re-weigh. Oven dry for an additional 30 minutes and re-weigh. Further drying is necessary if the two weighings differ by more than 1%.

This report shall not be reproduced except in full, without the written approval of the laboratory.
The results reported relate only to the samples indicated.
Soil/solid results are reported on a dry-weight basis unless otherwise noted.

Sample Extraction Logbook

%Moisture instructions: Determine the percent moisture for each solid sample by oven drying about 10.0g of sample at 105°C for 2 hours. Allow to cool in a dessicator and re-weigh. Oven dry for an additional 30 minutes and re-weigh. Further drying is necessary if the two weighings differ by more than 1%.

Submission of samples to Laboratory with a Chain of Custody constitutes a contract for services requested. Provide payment detail with each COC. If no payment information is provided, you will be contacted by the laboratory. We will make every effort to provide an accurate analysis of this sample. For reasonable cause, we will repeat the tests, but because of factors beyond our control, in sampling procedures and inherent sample variability in compost, soils, plants and water our liability is limited to the price of the tests.

Project Number L20180

PROJECT: Anatek Materials Testing

**SUBJECT: Results of Laboratory Testing
Report #2**

At your request, we provided laboratory testing services for the subject project. Services were limited to the performance of testing of laboratory tests, selected at your discretion.

For this period, our involvement was limited to laboratory testing of two samples delivered to our laboratory on May 14, 2020. Laboratory tests were conducted in general accordance with methods listed on the attached *Laboratory Summary* sheet.

If you have questions regarding this report, please call.

Respectfully Submitted,
Budinger & Associates, Inc.

Terri Ballard
Laboratory Manager

Sample Extraction Logbook

% Solid instructions: Determine the percent moisture for each solid sample by oven drying about 10.0g of sample at 105°C for 2 hours. Allow to cool in a desiccator and re-weigh. Oven dry for an additional 30 minutes and re-weigh. Further drying is necessary if the two weighings differ by more than 1%. Subtract %moisture from 100 to get %solid (100 - %moisture = % solid)

Appendix C Street & Catch Basin Weight Collected Raw Data

April 2018 Data Collection Event

Sediment Weight Field Data Collection Form: Roadway and Catch Basins

Pg. 1

Location (Circle One):		Street Sweeping		Catch Basin Cleaning	
Date of Data Collection:		4-20-18	Time of Data Collection:		9:30 AM ← Test site
Data Collectors Name:		Gordon Crane		10:30 AM ← Control site	
Test Site	Comments: Test site CB Clean - Tub # 1				
	(4-18-18) Weight of Empty Basin:	W ₁	110.4	pounds	
	Wet Weight of Sediments + Basin:	W ₂	303.4	pounds	
	Wet Weight of Sediments: W=W ₂ -W ₁	W	193.0	pounds	
	Duration Sediment Dewatered (Before Weighing)	T	7 days, 1/2 hr. (hours) 168.5	time	
	Cone & Quartering Technique Followed to Collect Samples for:	Moisture Content:	Organic Content:	Particle Size Distribution:	
	Number of Samples Collected:	Moisture Content:	Organic Content:	Particle Size Distribution:	
	Chain of Custody Form Completed:	Moisture Content:	Organic Content:	Particle Size Distribution:	
Control Site	Comments: Control Site CB Clean - Tub # 3				
	(4-18-18) Weight of Empty Basin:	W ₁	102.9	pounds	
	Wet Weight of Sediments + Basin:	W ₂	262.3	pounds	
	Wet Weight of Sediments: W=W ₂ -W ₁	W	159.4	pounds	
	Duration Sediment Dewatered (Before Weighing)	T	7 days (hours) 168.0	time	
	Cone & Quartering Technique Followed to Collect Samples for:	Moisture Content:	Organic Content:	Particle Size Distribution:	
	Number of Samples Collected:	Moisture Content:	Organic Content:	Particle Size Distribution:

Appendix M Audit Results

June 2018 Audit

Auditor name: Taylor Hoffman-Ballard		Date: 6/19/2018
Field staff name(s): Bryan, Glen, Gordon		Time: 9am
Standard Operating Procedure (SOP)	Actions Compliant with SOPs?	Comments:
Measuring Catch Basin Sediment Depth	Overall SOP audit notes:	
Prior to cleaning, 5 depth to sediment measurements collected in different spots	✓	Use lath, measure from top of rim so its easier to see value on lath
Depth to sediment measurements recorded	✓	
Following cleaning, 5 depth to CB floor measurements collected in different spots	✓	
Depth to CB floor measurements recorded	✓	
Catch Basin Sediment Collection	Overall SOP audit notes:	
Prior to start, vactor truck debris tank is clean	✓	Hoses which collect sediment are flushed too
Material on grate rim washed into catch basin sump	✓	
Material adhered to walls washed into catch basin sump	✓	
All material and water removed from catch basin	✓	
Typical catch basin cleaning procedures followed overall	✓	
Flushed residual sediment in outlet pipe to swale	✓	
Cleaning occurred for all CBs on both sides of street (test and control)	✓	
Material from CBs on each side of street placed into separate basins	✓	
Emptied all sediment from vactor truck into respective basin	✓	Empty all sediment by rinsing out the tank with water; note: any sediment which misses the basin is allowed to dry on concrete decant facility floor, then is scooped/shoveled into respective basin
Vactor truck debris tank cleaned	✓	
Roadway Sediment Collection	Overall SOP audit notes:	
Prior to start, sweeper debris tank is clean	✓	
Sweeping occurs as typically done on test side of street only (except in April)	✓	
Full length of study site swept	✓	
Emptied all sediment into respective basin (each side into separate basin in April)	✓	Empty all sediment by rinsing out the tank with water; note: any sediment which misses the basin is allowed to dry on concrete decant facility floor, then is scooped/shoveled into respective basin
Sweeper debris tank cleaned	✓	

Standard Operating Procedure (SOP)	Actions Compliant with SOPs?	Comments:
Catch Basin Sediment Washout Collection	Overall SOP audit notes:	
Sock tare weight obtained prior to installation	✓	Use scale to ±2g accuracy
Sock labeled and label matches respective upstream catch basin	✓	
Observe and note any tears, holes, etc. in sump sock	✓	
Sock sealed and placed in labeled plastic bag	✓	
Clean sock installed immediately following removal of previous sock	✓	
Tare weight of clean sock obtained prior to installation	✓	
COC filled out	✓	
Procedures followed for each sump	✓	
Dewatering and Weighing Sediment Samples	Overall SOP audit notes:	
Prior to start, basins are clean	✓	
Inspected filter fabric prior to placing sediment in basins	change	Because waited 1 week, filter fabric was not used for the top three rows of valves, as suggested in the alternative for the dewatering SOP.
Tare weight of basins plus pallets obtained prior to placing sediment in basins	✓	
Roadway and CB sediment allowed to settle for minimum of 1 hour	✓	Waited 1 week to allow for settling
Dewater according to SOP (20 minutes wait following each valve row)	change	Followed the alternative dewatering SOP (wait 7 days to dewater), and open valves from top to bottom without waiting 20 minutes between valves.
Wet weight of sediment, basin, and pallet obtained for each basin	✓	
Tare weights and wet weights recorded on appropriate form	✓	
Samples taken after weighing of sediment	✓	
Sample Collection and Handling: Moisture Content, Organic Content, and PSD	Overall SOP audit notes:	
Bowl and scoop washed with soap and water/cleaned and dried	✓	
Collected samples in 3-6 random locations several inches below surface	✓	
Homogenized sediment collected in bowl	✓	
Filled appropriate sample containers using homogenized sediment samples	✓	
Procedures followed for each basin	✓	
COC filled out	✓	
All basins emptied, cleaned, and dried	✓	

Standard Operating Procedure (SOP)	Actions Compliant with SOPs?	Comments:
Inspection of Study Area for Damage or Vandalism	Overall SOP audit notes:	
Inspections conducted once per week	✓	
Visually inspected inside of catch basin for spills or illicit discharges	✓	
Visually inspected sump for damage or vandalism	✓	
Record any incidents and the date of inspection	✓	No incidents so far
Maintain record of incidents during the study	✓	No incidents so far
Create pdf copies of inspections once per month and email to Project Manager	✓	No incidents so far
Calibration and Maintenance of Equipment: Scale and Weather Station	Overall SOP audit notes:	
Obtained records of maintenance and calibration activities from Direct TV, Inc.		Gordon to obtain from Direct TV
Obtained records of maintenance and calibration activities from scale vendor	✓	
Maintenance of Street Sweeper and Vector Truck	Overall SOP audit notes:	
Records of maintenance activities maintained		Gordon to email
PDF copies of records will be emailed to Project Manager		Gordon to email

Ellensburg Street Sweeping, CB Cleaning, and Sampling Event – June 19th, 2018

Sump sock for CB 4 shown above. Sump sock was removed and placed in a bag for dry weight and PSD sampling. Sediment accumulation reflects washout from the catch basin upstream between the April sampling event and June 19th.

The same sump sock is shown next to the sump basin from which it was removed. The inside of the outlet pipe is coated in the same sediment as was in the sock. Care was taken not to lose any of the sediment in the pipe when removing the sock.

The photo above shows the removed sock with “Test CB4 270 gr” written on the sock. 270 grams is the clean/tare weight of the sock prior to when it was installed.

The above two pictures display the new clean sock being installed. The sock is folded and placed in the sump box, and gorilla tape/duct tape is placed around the plastic ring and across the cut in the sock (done intentionally to get the sock onto the pipe). The sock fits tightly onto the pipe.

Photo of a closed sump box at the site and the upstream/area across the street

Picture of sweeper on the test side of the road (north)

Picture of the road after swept

Material left behind after sweeper completed sweeping at site (just beyond crown/end of contributing basin) and lifted vacuum head below truck to drive away

First photo shows the decant facility and basins with sweeper truck on the left and vactor truck on the right. Second photo shows the sweeper operator spraying out the inside of the debris tank to remove any remaining sediment inside the tank.

Photo shows street sweeping solids plus water used to wash out debris tank. Sediment on the decant facility floor (from emptying the sweeper debris tank) is typically allowed to dry and is scooped/shoveled into the basin with the rest of the sediment to minimize losses. Was told this amount is about 1/3 of what was collected from sweeping in April.

Another picture showing what was collected during the street sweeping. Slight sheen (possibly biological from breakdown of hay?) and hay chaff was observed.

Material collected during catch basin cleaning. Appeared to fill the basin to almost the same depth as in April. Smelled horrible. No dead mice observed.

August 2019 Audit

Auditor name: Taylor Hoffman-Ballard		Date: 8/28/2019
Field staff name(s): Bryan, Glen, Gordon		Time: 9am
Standard Operating Procedure (SOP)	Actions Compliant with SOPs?	Comments:
Measuring Catch Basin Sediment Depth	Overall SOP audit notes:	2018 Previous Audit Responses
Prior to cleaning, 5 depth to sediment measurements collected in different spots	✓	Use lath, measure from top of rim so its easier to see value on lath
Depth to sediment measurements recorded	✓	
Following cleaning, 5 depth to CB floor measurements collected in different spots	✓	
Depth to CB floor measurements recorded	✓	
Catch Basin Sediment Collection	Overall SOP audit notes:	2018 Previous Audit Responses
Prior to start, vactor truck debris tank is clean	✓	Hoses which collect sediment are flushed too
Material on grate rim washed into catch basin sump	NA	Typically no material on rim - whatever is present is blown into catch basin when Gordon lifts the grate to measure depth the day before catch basin cleaning
Material adhered to walls washed into catch basin sump	✓	
All material and water removed from catch basin	✓	
Typical catch basin cleaning procedures followed overall	✓	
Flushed residual sediment in outlet pipe to swale	✓	
Cleaning occurred for all CBs on both sides of street (test and control)	✓	
Material from CBs on each side of street placed into separate basins	✓	
Emptied all sediment from vactor truck into respective basin	✓	Empty all sediment by rinsing out the tank with water; note: any sediment which misses the basin is allowed to dry on concrete decant facility floor, then is scooped/shoveled into respective basin
Vactor truck debris tank cleaned	✓	
Roadway Sediment Collection	Overall SOP audit notes:	2018 Previous Audit Responses
Prior to start, sweeper debris tank is clean	✓	
Sweeping occurs as typically done on test side of street only (except in October)	✓	
Full length of study site swept	✓	
Emptied all sediment into respective basin (each side into separate basin in October)	✓	Empty all sediment by rinsing out the tank with water; note: any sediment which misses the basin is allowed to dry on concrete decant facility floor, then is scooped/shoveled into respective basin
Sweeper debris tank cleaned	NA	Will do in October, not applicable this month because only cleaning test side

Standard Operating Procedure (SOP)	Actions Compliant with SOPs?	Comments:
Catch Basin Sediment Washout Collection	Overall SOP audit notes:	2018 Previous Audit Responses
Sock tare weight obtained prior to installation	✓	Use scale to ±2g accuracy
Sock labeled and label matches respective upstream catch basin	✓	
Observe and note any tears, holes, etc. in sump sock	✓	Have never seen any tears, holes, etc. One time have seen duct tape off of the pipe and sock when the sump was opened, but the sock was still on the pipe.
Sock sealed and placed in labeled plastic bag	✓	
Clean sock installed immediately following removal of previous sock	✓	
Tare weight of clean sock obtained prior to installation	✓	
COC filled out	✓	
Procedures followed for each sump	✓	
Dewatering and Weighing Sediment Samples	Overall SOP audit notes:	2018 Previous Audit Responses
Prior to start, basins are clean	✓	The vacor truck is used to vacuum out any residual sediment, and the pressure hose on the vacor truck is used as needed to wash off any sediment
Inspected filter fabric prior to placing sediment in basins	NA	See previous Audit Response, still following change from June 2018
Tare weight of basins plus pallets obtained prior to placing sediment in basins	✓	Main difference between tare weights is due to differences in construction of pallets, adds up to a few pounds
Roadway and CB sediment allowed to settle for minimum of 1 hour		Change: See previous Audit Response, typically allow 5-7 days to dewater
Dewater according to SOP (20 minutes wait following each valve row)		Change: See previous Audit Response, typically allow 5-7 days to dewater
Wet weight of sediment, basin, and pallet obtained for each basin	✓	Change: Waited 1 week to allow for settling
Tare weights and wet weights recorded on appropriate form	✓	Change: Followed the alternative dewatering SOP (wait 7 days to dewater), and open valves from top to bottom without waiting 20 minutes between valves.
Samples taken after weighing of sediment	✓	
Sample Collection and Handling: Moisture Content, Organic Content, and PSD	Overall SOP audit notes:	2018 Previous Audit Responses
Bowl and scoop washed with soap and water/cleaned and dried		Change: Use disposable gloves to scoop material directly into sample jars
Collected samples in 3-6 random locations several inches below surface	NA	Change: Since homogenize full basin of material (see note below), not applicable
Homogenized sediment collected in bowl		Change: To homogenize, all material is mixed within the basin using a metal shovel
Filled appropriate sample containers using homogenized sediment samples	✓	
Procedures followed for each basin	✓	
COC filled out	✓	
All basins emptied, cleaned, and dried	✓	

Standard Operating Procedure (SOP)	Actions Compliant with SOPs?	Comments:	
Inspection of Study Area for Damage or Vandalism		Overall SOP audit notes:	2018 Previous Audit Responses
Inspections conducted once per week		Change: Driving by every other week - have not seen much foot traffic around site. Looking for obvious signs of damage or vandalism when inspect	
Visually inspected inside of catch basin for spills or illicit discharges		Change: Driving by every other week - have not seen much foot traffic around site. Look inside of catch basins during depth measurements day before sample collection day. Have not observed any spills or discharges	
Visually inspected sump for damage or vandalism		Change: Driving by every other week - have not seen much foot traffic around site. Looking for obvious signs of damage or vandalism when inspect	
Record any incidents and the date of inspection	✓	No incidents so far	No incidents so far
Maintain record of incidents during the study	✓	No incidents so far	No incidents so far
Create pdf copies of inspections once per month and email to Project Manager	✓	No incidents so far	No incidents so far
Calibration and Maintenance of Equipment: Scale and Weather Station		Overall SOP audit notes:	2018 Previous Audit Responses
Obtained records of maintenance and calibration activities from Direct TV, Inc.	✓	Gordon to call and request records	Gordon to obtain from Direct TV
Obtained records of maintenance and calibration activities from scale vendor	✓	Gordon to request records	
Maintenance of Street Sweeper and Vactor Truck		Overall SOP audit notes:	2018 Previous Audit Responses
Records of maintenance activities maintained	✓	Have these in a spreadsheet; need to contact new manager of spreadsheet for a copy	Gordon to email
PDF copies of records will be emailed to Project Manager	✓	Gordon to send copies of records	Gordon to email

Appendix N Equipment Maintenance Records

135 - 2012 International 7600 - Vactor truck	Date of Service Order	Date Task Completed	Hours (vac engine)	Odometer	Complaint/Issue	Mechanic's Tasks	Mechanic Name
135	3/12/2018	3/21/2018			blower motor in cab not working.	Checked blower. Checked circuit breaker. Both OK and working.	
135	8/22/2018	8/22/2018	2700			Service call for transmission range inhibited.	
135	8/28/2018					scanned truck and found a code for low voltage or mis-communication between the transmission and the computer. Could not find the problem at this time.	Bryan
135	8/28/2018					Replaced the radiator and air cooler.	Tyge
135	12/4/2018	12/4/2018	2843		Hydraulic functions work intermittently.		
135	12/27/2018					Found a bad wire in the lower valve loom. By-passed wire and ordered a new loom.	
135	12/27/2018					Ordered a New Set of Bearings For Fan Shaft and Idler Pulley	
135	2/6/2019	2/6/2019	2,875			Side wall assembly, routine servicing	
135	4/30/2019	5/7/2019	3,044	15,825		heater & A/C unit	
135	6/27/2019	7/15/2019	3,044	15,825		routine servicing	
135	6/27/2019	7/8/2019	3,044	18,000		air to air boot replacement	KA
135A	5/11/2018	5/11/2018	2,594		Needs forced re-gen.	Went to treatment plant and found exhaust 100% plugged. Did 3 forced re-gens to get down to 5%.	KA
135A	5/11/2018	5/14/2018	2,601			routine servicing	TT
135A	8/22/2018	8/22/2018				Radiator is leaking.	
135A	1/15/2019	1/18/2019			Vacuum door would not open.	Found a bad relay for the hydraulic valve that opens the door. Replaced with a used relay.	
135A	2/6/2019	2/7/2019	2,889			routine servicing	
135A	3/27/2019	3/29/2019				Power shaft assembly	

Note: 135A, 160A and, 161A are the attached assemblies of the equipment.

160 - 2016 Freightliner M2 - Street Sweeper	Date of Service Order	Date Task Completed	Hours (vac engine)	Odometer	Complaint/Issue	Mechanic's Tasks	Mechanic Name
161	2/9/2018	2/9/2018				Added air line and did pre season check. Prime water pump.	
160	4/19/2018	4/19/2018			Service call. No throttle or fuel gauge.	Went to Manitoba and Pine and switched back to right side controls.	
160	4/19/2018	4/19/2018			Leaking hydraulic oil.	Tightened fitting on bottom of lift cylinder.	
161	6/28/2018	7/2/2018			A/C needs to be recharged	Replaced cabin air filter	
160	7/16/2018	7/16/2018			Check fan for noise.	Steam cleaned fan and housing. OK at this time.	Glen
160	7/18/2018					Check noise in sweeper, found fan bearings going bad.	JM
160	7/18/2018					Fan Bearing	KA
160	7/18/2018	7/18/2018				Washed out fan on blower, installed new mirrors	TT
160	7/18/2018	7/23/2018				Found fan bearings failing also found air blocker air solenoid needed repair. Changed out fan bearings, idler pulley bearings, fan belt and repaired air solenoid for air blocker.	Glen
160	7/23/2018	7/23/2018		8,256		routine servicing	KA
160	8/1/2018	8/1/2018				Found inner fan bearing had too much play. Replaced inner fan bearing. Installed another shim in the idler pulley.	Glen
160	8/22/2018	8/22/2018				routine servicing	Rodney
160	8/23/2018	8/23/2018				Replaced curtain set in head. Weld worn latches on hopper door lock.	Jack
160	10/2/2018	10/2/2018				Serviced and tightened fan belt.	Glen
160	10/11/2018	10/11/2018				Changed brooms.	Glen
160	10/16/2018	10/16/2018				Rocker switch on rear bumper replaced.	Glen
160		10/28/2018				routine servicing	JM
160		12/28/2018		10,696		routine servicing	KA
160	5/14/2019	5/16/2019		11,675		routine servicing	
160	9/26/2019	9/26/2019				routine servicing	
160A	7/23/2018	7/23/2018	1,565			routine servicing	KA
160A	7/27/2018	7/27/2018	1,572		Fan making a clunking sound.		JM
160A	10/1/2018	10/2/2018	1,728			routine servicing	KA
160A		10/28/2018				routine servicing	JM
160A		12/28/2018	1,884			routine servicing	KA
160A	1/11/2019	1/11/2019	1,959			replace broom assembly	
160A	4/18/2019	4/18/2019	1,959			replace sweeping unit	
160A	5/14/2019	5/17/2019	2,022			routine servicing	
160A	6/10/2019	6/10/2019				replace sweeping unit	
160A	7/11/2019	7/15/2019				replace broom assembly	
160A	7/16/2019		2,156			dust supression	
160A		9/26/2019				Replaced wandering hose switch and built dummy plug for next time.	
160A	9/26/2019	9/26/2019				routine servicing	

Note: 135A, 160A and, 161A are the attached assemblies of the equipment.

161 - 2016 Elgin Crosswind - Street Sweeper	Date of Service Order	Date Task Completed	Hours (vac engine)	Odometer	Complaint/Issue	Mechanic's Tasks	Mechanic Name
161	7/18/2018	8/20/2018	1,547	5,280		Pick up hood needs new curtains.	KA
161	7/26/2018					Needs a new back up alarm.	KA
161	8/2/2018					Replaced light with LED. Replaced broken hose to tank	Glen
161	8/16/2018	8/20/2018	1,547	5,280		Hood needs new curtains.	KA
161	8/16/2018	8/20/2018	1,547	5,280		Service due.	KA
161	8/22/2018					Serviced engine.	Rodney
161		10/12/2018				Replaced back up alarm.	Jack
161	11/5/2018	11/5/2018				Service call for broken clevis on hood pick up chain.	JM
161	11/27/2018	11/27/2018				Hood lift cylinder clevis broke.	JM
161	12/3/2018	12/31/2018	1,799	6,457		routine servicing	KA
161	4/18/2019	4/18/2019	1,959	7,254		replace sweeping unit	
161	5/14/2019	5/17/2019	2,043	7,793		routine servicing	
161		9/26/2019		9,288		routine servicing	
161A	8/1/2018	8/2/2018				Right gutter broom light is out, Fill hose to rear tank is leaking.	KA
161A	8/16/2018	8/20/2018				Service due.	KA
161A	12/3/2018	12/31/2018				routine servicing	KA
161A	5/14/2019	5/17/2019	2,043			replace broom assembly	
161A	5/30/2019	6/3/2019	2,049			replace coupling	
161A	7/18/2019	8/1/2019				replace shared power hydraulic motor fitting	
161A		9/26/2019				replace broom assembly	
161A		9/26/2019				routine servicing	
161A	10/29/2019	10/29/2019				routine servicing	

Note: 135A, 160A and, 161A are the attached assemblies of the equipment.

Appendix Q TAG TER Comments & Responses to Comments

TAG TER Coments Responses to Comments

Comment #	Commenter Initials	Section	Page	Comment	Suggested Revision to TER	OCI Response to Comment
1	BCM/WW	2	3	In paragraph 2, second sentence, use of the verb 'was' seems like the wrong tense.	Suggest changing to 'were'.	Updated to 'were'.
2	CP/CSV	2	3	2nd para, 6th sentence. Different description then comment 2	correct grammar and also it appears to repeat. The second description appears correct.	Description of study has been updated in Section 2.0 to be consistent.
3	BCM/WW	3.1	4	In paragraph 1, sentence describing catchbasins with the words catchbasins in parenthesis.	Should the term sump be used in stead of catchbasin?	Wording has been updated to 'sump'.
4	DW/WR	Fig 3.2	7	Reference in Figure title to left and right does not seem to apply to the figure.	Suggest omitting reference altogether or replacing with color code (brown/green)	Replaced with color code.
	KD	3.2		did this option continue in 2019? Try to reference both permits each time - either as having the same requirements or not		Table 3.1 was added that compares the relevant NPDES MS4 requirements between EWA and WWA for the 2019-2024 permit.
5	CP/CSV	3.4	8	1st para, 5th sentence. Different description then comment 1		Description of study has been updated in Section 2.0 to be consistent.
6	CP/CSV	3.4	8	2nd para, 1st sentence. Restate, sentence does not read clearly		Updated text.
7	CP/CSV	3.4	9	1st para, 4th sentence. Organic content was determined only for the catch basin sediment?	clarify where testing was conducted	Clarified text.
8	DCH	3.4	8	Last paragraph " <i>transferred from the catch basins was be collected and measured.</i> "	Delete "be"	Deleted "be".
9	DCH	3.4	9	Bullet 1 " <i>Characterize the sediment collected from each sample location</i> " How do you characterize the sediment, weight, PSD, % of total, etc.?		Revised text as follows: <i>Characterize the sediment collected (particle size distribution and organic content)</i> Also updated in Secton 7.1 for consistency.
10	DCH	4.3	15	" <i>The city owns one street sweeper, an Elgin Crosswind J street sweeper, and two vactor trucks, VacCon Combination Truck.</i> " In earlier text you said two sweepers and one vactor truck.	Confirm number of sweepers and vactors	There are two vactor trucks and one sweeper. Earlier text was updated to reflect this.
11	DCH	5.1	17	You might want to note that the test side of the road changed after the first year saying which side was the test side (south or north) in year one and the other side was the test side in year 2.		Added text to the table to clarify.
12	BCM/WW	7.1.2	31	When did the heavy rainstorm event occur? Could this one heavy rain event somehow influenced the organic content in the SS samples by washing them into the CBs? Likewise, could the CB samples have been impacted by having more organic content washed into them?	For discussion by the group and consideration if this event could have affected the sampling data. consider adding more about the heavy event and when it occurred. Add references in this section for when items are further discussed in a subsequent section.	Added text to report.
13	BCM/WW	7.1.2	31	In paragraph 3, fourth sentence, omitted the word 'from'.	Suggest inserting the word from after the first word Results.	Updated text.

TAG TER Coments Responses to Comments

Comment #	Commenter Initials	Section	Page	Comment	Suggested Revision to TER	OCI Response to Comment
14	BCM/WW	7.1.2	38	In Paragraph 2, discussion about the accumulation rate of sediment in October being higher than expected, could this be explained by the fact that most hay hauling is done later in the season (Sept. and Oct.)? Hard to make the correlation but maybe worth a mention.	For discussion by the group and consideration if this event could have affected the sampling data. mention that hay hauling season may have influenced accumulation rate. In general add discuss about hay hauling in section 7. "Generally the hay hauling season is month to month".	Discussion about hay hauling was added. However there is insufficient data to draw conclusions about organic content variability as a function of season.
15	BCM/WW	7.1.4	45	In Paragraph 3, first sentence. Wording indicates something omitted in the sentence.	Author's discretion.	No change was made
16	BCM/WW	7.3.2	50	In Paragraph 1, sentence 5. "except" is used instaed of exception.	Correction	Updated text.
17	BCM/WW	7.3.2	50	Have you considered including Pan Evaporation Rates for Eburg into the discussion? Evaporation rates are high in semi-arid/arid regions. Records indicate that it rained less than it normally does during the test period and the average wind speeds were close to normal? But what about over all evaporation for the period? Would a higher evaporation rate have any influence on the accumulation data?	For discussion by the group and consideration if this event could have affected the sampling data. Include discussion about evaporation rates in semi-arid locations and how this could influence data. Discuss pan evap rates from winter to summer. Add to weather.	The pan evaporation rates were not identified as a variable that would influence sediment accumulation rates and thus not included in the data collection.
18	BCM/WW	7.3.2	52	How were the Sample Collection Event dates chosen? Were these dates affected by rainfall events? If yes, could this have affected the data collection and outcomes?	For discussion by the group and consideration if this event could have affected the sampling data. Explain in the study.	No change was made to this section because there is discussion regarding the influence of rainfall event on the data. Also the data a was normalized based on the number days since the last sample collection event. Section 8 provides an example of how rainfall events can influent the data.
19	BCM/WW	7.3.2	52,53	Figures 7.21 & 7.22 refer to Daily Precipitation. During the winter months, weren't these events snow events due to the time of year? If so, a comment should be added somewhere to clarify that the "precipitation" measured was snowmelt and not rainfall. And what about plowing during the winter months? Was only sand and salt applied or were the roads plowed as well?	For discussion by the group and consideration if this event could have affected the sampling data. Add a discussion about winter practices including that WSDOT provides this. Also clarify that precipitation is both rainfall and rain equivalent of snow fall	The total precipitation includes both rain and snow fall. The following was added to the first paragraph: <i>These precipitation depths include the measured rainfall depths as well as the rainfall equivalent depth of snow fall.</i>
20	BCM/WW	7.4	53	In Paragraph 1, sentence 2. "include" should be changed to included.	Correction	Updated to "included"
21	CP/CSV	8	56	last sentence, first paragraph. This statement seems to conflict with the above statement.		Clarification was added to both the first and second paragraph in Section 8

TAG TER Coments Responses to Comments

Comment #	Commenter Initials	Section	Page	Comment	Suggested Revision to TER	OCI Response to Comment
	KD	8		Second paragraph regarding reference to timing street sweeping with rainfall events: how would this be possible? it also would not reflect real-world practices. might it not make more sense to recommend that sweeping could be delayed for a certain amount of time following an intense rainfall event?		Provided text that clarifies that the statement about timing street sweeping with rainfall events was intended to provide an example of how difficult it would be to reduce the variability of real world conditions.
	KD	8.1		clarify that sweeping should occur at regular frequencies.		clarified
22	BCM/WW	8.1	57	In the first sentence, the word "were" should be changed to where.	Correction	Updated to "where"
23	DCH	8.1	57	You just say "reference" in the bulk density paragraph of your step-by-step process for developing Figure 7.24. Don't you need to list a reference?	Add specific reference or delete reference	reference added. Also the reference was for 85% not 80% compaction as previously listed so the estimated compaction of catch basin sediment was increased to 65% for developing Figure 7.24
24	CP/CSV	8.2	58	2nd para, 2nd sentence. Does this statement say the opposite of what was stated above?		revisions were made to the paragraph to provided clarification.
25	BCM/WW	8.2	58	In the first sentence, the word "a" appears to be left out between with and recommended. Also, in second sentence, the word "were" should be changed to where.	Correction	Updated text.
26	BCM/WW	8.2	58	In paragraph 2, sentence 1, the word reported should be used instead of report.	Correction	Updated text.
27	BCM/WW	8.2	59	Should there be some mention about the lack of trees at this test site and how the presence of trees in other locations will have a profound effect on the sediment type and accumulation rates?	For discussion by the group and consideration if this event could have affected the sampling data.	Added text to report.
	KD	8.2		Second Paragraph regarding trasferability of recommendations to different sites: as long as there aren't trees dropping leaf litter?		Additional text was added to the section regarding how the presence of treas may impact the transferability of the recommendations to other sites.
28	DCH	9	60	Text incomplete, still need to provide final conclusions.	Compleat text	Section 9 is the conclusion and it was left blank until after the TAG comments/disscusion. It has been completed in the final paper.
29	DCH	5.2.1	18	"November 25, 2018 to March 6, 2019 and from June 17, 2019 to end of study." Where did you get weather data from for March 19 to June 19?		Added text to clarify.
